<b>(57) Abstract</b>  The present invention describes novel compounds of formula: (Q) <sub>d</sub> -L <sub>a</sub> -C <sub>b</sub> , useful for the diagnosis and treatment of cancer, methods of imaging tumors in a patient, and methods of treating cancer in a patient. The present invention also provides novel compounds useful for monitoring therapeutic angiogenesis treatment and destruction of new angiogenic vasculature. The present invention further provides novel compounds useful for imaging atherosclerosis, restenosis, cardiac ischemia, and myocardial reperfusion injury. The present invention still further provides novel compounds useful for the treatment of rheumatoid arthritis. The pharmaceuticals are comprised of a targeting moiety that binds to a receptor that is upregulated during angiogenesis, and optional linking group, and a therapeutically effective radioisotope or diagnostically effective imageable moiety. The imageable moiety is a gamma ray or positron emitting radioisotope, a magnetic resonance imaging contrast agent, and X-ray contrast agent, or an ultrasound contrast agent.

TITLE

## VITRONECTIN RECEPTOR ANTAGONIST PHARMACEUTICALS

FIELD OF THE INVENTION

5       The present invention provides novel pharmaceuticals useful for the diagnosis and treatment of cancer, methods of imaging tumors in a patient, and methods of treating cancer in a patient. The pharmaceuticals are comprised of a targeting moiety that binds to the vitronectin  
10      receptor that is expressed in tumor vasculature, an optional linking group, and a therapeutically effective radioisotope or diagnostically effective imageable moiety. The therapeutically effective radioisotope emits a gamma ray or alpha particle sufficient to be cytotoxic.  
15      The imageable moiety is a gamma ray or positron emitting radioisotope, a magnetic resonance imaging contrast agent, an X-ray contrast agent, or an ultrasound contrast agent.

20

BACKGROUND OF THE INVENTION

Cancer is a major public health concern in the United States and around the world. It is estimated that over 1 million new cases of invasive cancer will be  
25      diagnosed in the United States in 1998. The most prevalent forms of the disease are solid tumors of the lung, breast, prostate, colon and rectum. Cancer is typically diagnosed by a combination of in vitro tests and imaging procedures. The imaging procedures include  
30      X-ray computed tomography, magnetic resonance imaging, ultrasound imaging and radionuclide scintigraphy. Frequently, a contrast agent is administered to the patient to enhance the image obtained by X-ray CT, MRI and ultrasound, and the administration of a  
35      radiopharmaceutical that localizes in tumors is required for radionuclide scintigraphy.

Treatment of cancer typically involves the use of external beam radiation therapy and chemotherapy, either alone or in combination, depending on the type and extent

of the disease. A number of chemotherapeutic agents are available, but generally they all suffer from a lack of specificity for tumors versus normal tissues, resulting in considerable side-effects. The effectiveness of these 5 treatment modalities is also limited, as evidenced by the high mortality rates for a number of cancer types, especially the more prevalent solid tumor diseases. More effective and specific treatment means continue to be needed.

10       Despite the variety of imaging procedures available for the diagnosis of cancer, there remains a need for improved methods. In particular, methods that can better differentiate between cancer and other pathologic conditions or benign physiologic abnormalities are 15 needed. One means of achieving this desired improvement would be to administer to the patient a metallopharmaceutical that localizes specifically in the tumor by binding to a receptor expressed only in tumors or expressed to a significantly greater extent in tumors 20 than in other tissue. The location of the metallopharmaceutical could then be detected externally either by its imageable emission in the case of certain radiopharmaceuticals or by its effect on the relaxation rate of water in the immediate vicinity in the case of 25 magnetic resonance imaging contrast agents.

          This tumor specific metallopharmaceutical approach can also be used for the treatment of cancer when the metallopharmaceutical is comprised of a particle emitting radioisotope. The radioactive decay of the isotope at 30 the site of the tumor results in sufficient ionizing radiation to be toxic to the tumor cells. The specificity of this approach for tumors minimizes the amount of normal tissue that is exposed to the cytotoxic agent and thus may provide more effective treatment with 35 fewer side-effects.

          Previous efforts to achieve these desired improvements in cancer imaging and treatment have centered on the use of radionuclide labeled monoclonal antibodies, antibody fragments and other proteins or

polypeptides that bind to tumor cell surface receptors. The specificity of these radiopharmaceuticals is frequently very high, but they suffer from several disadvantages. First, because of their high molecular weight, they are generally cleared from the blood stream very slowly, resulting in a prolonged blood background in the images. Also, due to their molecular weight they do not extravasate readily at the site of the tumor and then only slowly diffuse through the extravascular space to the tumor cell surface. This results in a very limited amount of the radiopharmaceutical reaching the receptors and thus very low signal intensity in imaging and insufficient cytotoxic effect for treatment.

Alternative approaches to cancer imaging and therapy have involved the use of small molecules, such as peptides, that bind to tumor cell surface receptors. An In-111 labeled somatostatin receptor binding peptide, In-111-DTPA-D-Phe<sup>1</sup>-octeotide, is in clinical use in many countries for imaging tumors that express the somatostatin receptor (Baker, et al. Life Sci., 1991, 49, 1583-91 and Krenning, et al., Eur. J. Nucl. Med., 1993, 20, 716-31). Higher doses of this radiopharmaceutical have been investigated for potential treatment of these types of cancer (Krenning, et al., Digestion, 1996, 57, 57-61). Several groups are investigating the use of Tc-99m labeled ananlogs of In-111-DTPA-D-Phe<sup>1</sup>-octeotide for imaging and Re-186 labeled analogs for therapy (Flanagan, et al., U.S. 5,556,939, Lyle, et al., U.S. 5,382,654, and Albert et al., U.S. 5,650,134).

Angiogenesis is the process by which new blood vessels are formed from pre-existing capillaries or post capillary venules; it is an important component of a variety of physiological processes including ovulation, embryonic development, wound repair, and collateral vascular generation in the myocardium. It is also central to a number of pathological conditions such as tumor growth and metastasis, diabetic retinopathy, and macular degeneration. The process begins with the

activation of existing vascular endothelial cells in response to a variety of cytokines and growth factors. Tumor released cytokines or angiogenic factors stimulate vascular endothelial cells by interacting with specific 5 cell surface receptors for the factors. The activated endothelial cells secrete enzymes that degrade the basement membrane of the vessels. The endothelial cells then proliferate and invade into the tumor tissue. The endothelial cells differentiate to form lumens, making 10 new vessel offshoots of pre-existing vessels. The new blood vessels then provide nutrients to the tumor permitting further growth and a route for metastasis.

Under normal conditions, endothelial cell proliferation is a very slow process, but it increases 15 for a short period of time during embryogenesis, ovulation and wound healing. This temporary increase in cell turnover is governed by a combination of a number of growth stimulatory factors and growth suppressing factors. In pathological angiogenesis, this normal 20 balance is disrupted resulting in continued increased endothelial cell proliferation. Some of the proangiogenic factors that have been identified include basic fibroblast growth factor (bFGF), angiogenin, TGF-alpha, TGF-beta, and vascular endothelium growth factor 25 (VEGF). While interferon-alpha, interferon-beta and thrombospondin are examples of angiogenesis suppressors.

The proliferation and migration of endothelial cells in the extracellular matrix is mediated by interaction with a variety of cell adhesion molecules (Folkman, J., 30 Nature Medicine , 1995, 1, 27-31). Integrins are a diverse family of heterodimeric cell surface receptors by which endothelial cells attach to the extracellular matrix, each other and other cells. The integrin  $\alpha\beta$ , is a receptor for a wide variety for a wide variety of 35 extracellular matrix proteins with an exposed tripeptide Arg-Gly-Asp moiety and mediates cellular adhesion to its ligand: vitronectin, fibronectin, and fibrinogen, among others. The integrin  $\alpha\beta$ , is minimally expressed on normal

blood vessels, but is significantly upregulated on vascular cells within a variety of human tumors. The role of the  $\alpha_1\beta_1$  receptors is to mediate the interaction of the endothelial cells and the extracellular matrix and 5 facilitate the migration of the cells in the direction of the angiogenic signal, the tumor cell population. Angiogenesis induced by bFGF or TNF-alpha depend on the agency of the integrin  $\alpha_1\beta_1$ , while angiogenesis induced by VEGF depends on the integrin  $\alpha_1\beta_1$ , (Cheresh et. al., 10 Science, 1995, 270, 1500-2). Induction of expression of the integrins  $\alpha_1\beta_1$  and  $\alpha_2\beta_1$  on the endothelial cell surface is another important mechanism by which VEGF promotes angiogenesis (Senger, et. al., Proc. Natl. Acad. Sci USA, 1997, 84, 13612-7).

15 Angiogenic factors interact with endothelial cell surface receptors such as the receptor tyrosine kinases EGFR, FGFR, PDGFR, Flk-1/KDR, Flt-1, Tek, tie, neuropilin-1, endoglin, endosialin, and Axl. The receptors Flk-1/KDR, neuropilin-1, and Flt-1 recognize 20 VEGF and these interactions play key roles in VEGF-induced angiogenesis. The Tie subfamily of receptor tyrosine kinases are also expressed prominently during blood vessel formation.

Because of the importance of angiogenesis to tumor 25 growth and metastasis, a number of chemotherapeutic approaches are being developed to interfere with or prevent this process. One of these approaches, involves the use of anti-angiogenic proteins such as angiostatin and endostatin. Angiostatin is a 38 kDa fragment of 30 plasminogen that has been shown in animal models to be a potent inhibitor of endothelial cell proliferation. (O'Reilly et. al., Cell, 1994, 79, 315-328) Endostatin is a 20 kDa C-terminal fragment of collagen XVIII that has also been shown to be a potent inhibitor. (O'Reilly 35 et. al., Cell, 1997, 88, 277-285) Systemic therapy with endostatin has been shown to result in strong anti-tumor activity in animal models. However, human clinical trials

of these two chemotherapeutic agents of biological origin have been hampered by lack of availability.

Another approach to anti-angiogenic therapy is to use

- 5 targeting moieties that interact with endothelial cell surface receptors expressed in the angiogenic vasculature to which are attached chemotherapeutic agents. Burrows and Thorpe (Proc. Nat. Acad. Sci., USA, 1993, 90, 8996-9000) described the use of an antibody-immunotoxin
- 10 conjugate to eradicate tumors in a mouse model by destroying the tumor vasculature. The antibody was raised against an endothelial cell class II antigen of the major histocompatibility complex and was then conjugated with the cytotoxic agent, deglycosylated ricin
- 15 A chain. The same group (Clin. Can. Res., 1995, 1, 1623-1634) investigated the use of antibodies raised against the endothelial cell surface receptor, endoglin, conjugated to deglycosylated ricin A chain. Both of these conjugates exhibited potent anti-tumor activity in mouse
- 20 models. However, both still suffer drawbacks to routine human use. As with most antibodies or other large, foreign proteins, there is considerable risk of immunologic toxicity which could limit or preclude administration to humans. Also, while the vasculature
- 25 targeting may improve the local concentration of the attached chemotherapeutic agents, the agents still must be cleaved from the antibody carrier and be transported or diffuse into the cells to be cytotoxic.

- Thus, it is desirable to provide anti-angiogenic pharmaceuticals and tumor or new vasculature imaging agents which do not suffer from poor diffusion or transportation, possible immunologic toxicity, limited availability, and/or a lack of specificity.

- Another application of anti-angiogenic therapy is in treating rheumatoid arthritis (RA). In RA, the ingrowth of a highly vascularized pannus is caused by the excessive production of angiogenic factors by the infiltrating macrophages, immune cells, or inflammatory cells. Therefore, it is desirable to have new

pharmaceuticals to destroy the highly vascularized pannus that results and thus treat the disease.

There is also a growing interest in therapeutic angiogenesis to improve blood flow in regions of the body  
5 that have become ischemic or poorly perfused. Several investigators are using growth factors administered locally to cause new vasculature to form either in the limbs or the heart. The growth factors VEGF and bFGF are the most common for this application. Recent  
10 publications include: Takeshita, S., et. al., J. Clin. Invest., 1994, 93, 662-670; and Schaper, W. and Schaper, J., Collateral Circulation:Heart, Brain, Kidney, Limbs, Kluwer Academic Publishers, Boston, 1993. The main applications that are under investigation in a number of  
15 laboratories are for improving cardiac blood flow and in improving peripheral vessel blood flow in the limbs. For example, Henry, T. et. al. (J. Amer. College Cardiology, 1998, 31, 65A) describe the use of recombinant human VEGF in patients for improving myocardial perfusion by  
20 therapeutic angiogenesis. Patients received infusions of rhVEGF and were monitored by nuclear perfusion imaging 30 and 60 days post treatment to determine improvement in myocardial perfusion. About 50% of patients showed improvement by nuclear perfusion imaging whereas 5/7  
25 showed new collateralization by angiography. Thus, it is desirable to discover a method of monitoring improved cardiac blood flow which is targeted to new collateral vessels themselves and not, as in nuclear perfusion imaging, a regional consequence of new collateral  
30 vessels.

The detection, imaging and diagnosis of a number of cardiovascular diseases need to be improved, including restenosis, atherosclerosis, myocardial reperfusion injury, and myocardial ischemia, stunning or infarction.  
35 It has recently been determined that in all of these disease conditions, the integrin receptor  $\alpha v \beta 3$  plays an important role.

For example, in the restenosis complication that occurs in ~30-50% of patients having undergone angioplasty or stent placement, neointimal hyperplasia and ultimate reocclusion is caused by aggressively

- 5 proliferating vascular smooth muscle cells that express  $\alpha v \beta 3$ . (Cardiovascular Res., 1997, 36, 408-428; DDT, 1997, 2, 187-199; Current Pharm. Design, 1997, 3, 545-584)

Atherosclerosis proceeds from an intial endothelial damage that results in the recruitment and subintimal  
10 migration of monocytes at the site of the injury. Growth factors are released which induce medial smooth muscle cells to proliferate and migrate to the intimal layer.

The migrating smooth muscle cells express  $\alpha v \beta 3$ .

- In reperfusion injury, neutrophil transmigration is  
15 integrin dependent and the integrins moderate initial infiltration into the viable border zone. The induction of  $\alpha 5 \beta 1$ ,  $\alpha 4 \beta 1$  and  $\alpha v \beta 5$  in infiltrating neutrophils occurs within 3 to 5 hours after reperfusion as neutrophils move from the border zone to the area of necrosis.
- 20 (Circulation, 1999, 100, I-275)

- Acute or chronic occlusion of a coronary artery is known to result in angiogenesis in the heart as native collateral vessels are recruited to attempt to relieve the ischemia. However, even a gradual occlusion usually  
25 results in areas of infarction as the resulting angiogenesis is not sufficient to prevent damage. Cardiac angiogenesis has been associated with increased expression of the growth factors VEGF and FGF and the upregulation of the growth factor receptors flt-1 and  
30 flk-1/KDR. (Drugs, 1999, 58, 391-396)

SUMMARY OF THE INVENTION

It is one object of the present invention to provide improved anti-angiogenic pharmaceuticals, comprised of a targeting moiety that binds to the vitronectin receptor 5 that is expressed in tumor neovasculature, an optional linking group, and a radioisotope. The vitronectin receptor binding compounds target the radioisotope to the tumor neovasculature. The beta or alpha-particle emitting radioisotope emits a cytotoxic amount of 10 ionizing radiation which results in cell death. The penetrating ability of radiation obviates the requirement that the cytotoxic agent diffuse or be transported into the cell to be cytotoxic.

It is another object of the present invention to 15 provide pharmaceuticals to treat rheumatoid arthritis. These pharmaceuticals comprise a targeting moiety that binds to a receptor that is upregulated during angiogenesis, an optional linking group, and a radioisotope that emits cytotoxic radiation (i.e., beta 20 particles, alpha particles and Auger or Coster-Kronig electrons). In rheumatoid arthritis, the ingrowth of a highly vascularized pannus is caused by the excessive production of angiogenic factors by the infiltrating macrophages, immune cells, or inflammatory cells. 25 Therefore, the radiopharmaceuticals of the present invention that emit cytotoxic radiation could be used to destroy the new angiogenic vasculature that results and thus treat the disease.

It is another object of the present invention to 30 provide imaging agents, comprised of vitronectin receptor binding compounds conjugated to an imageable moiety, such as a gamma ray or positron emitting radioisotope, a magnetic resonance imaging contrast agent, an X-ray contrast agent, or an ultrasound contrast agent. These 35 imaging agents are useful for imaging tumor neovasculature, therapeutic angiogenesis interventions in the heart, natural angiogenic processes in response to acute or chronic coronary vessel occlusion, restenosis

post-angioplasty, atherosclerosis and plaque formation, and reperfusion injury.

- It is another object of the present invention to provide compounds useful for preparing the pharmaceuticals of the present invention. These compounds are comprised of a non-peptide quinolone containing targeting moiety that binds to a receptor that is upregulated during angiogenesis or during cardiovascular diseases, Q, an optional linking group,
- 10 L<sub>n</sub>, and a metal chelator or bonding moiety, Ch. The compounds may have one or more protecting groups attached to the metal chelator or bonding moiety. The protecting groups provide improved stability to the reagents for long-term storage and are removed either immediately
- 15 prior to or concurrent with the synthesis of the radiopharmaceuticals. Alternatively, the compounds of the present invention are comprised of a peptide or peptidomimetic targeting moiety that binds to a receptor that is upregulated during angiogenesis or during
- 20 cardiovascular diseases, Q, an optional linking group, L<sub>n</sub>, and a surfactant, S<sub>f</sub>.

The pharmaceuticals of the present invention may be used for diagnostic and/or therapeutic purposes.

- Diagnostic radiopharmaceuticals of the present invention are pharmaceuticals comprised of a diagnostically useful radionuclide (i.e., a radioactive metal ion that has imageable gamma ray or positron emissions). Therapeutic radiopharmaceuticals of the present invention are pharmaceuticals comprised of a therapeutically useful radionuclide, a radioactive metal ion that emits ionizing radiation such as beta particles, alpha particles and Auger or Coster-Kronig electrons.

- The pharmaceuticals comprising a gamma ray or positron emitting radioactive metal ion are useful for imaging tumors and by gamma scintigraphy or positron emission tomography. The pharmaceuticals comprising a gamma ray or positron emitting radioactive metal ion are also useful for imaging therapeutic angiogenesis, natural

angiogenic processes in response to acute or chronic coronary vessel occlusion, restenosis post-angioplasty, atherosclerosis and plaque formation, and reperfusion injury by gamma scintigraphy or positron emission

5       tomography. The pharmaceuticals comprising a particle emitting radioactive metal ion are useful for treating cancer by delivering a cytotoxic dose of radiation to the tumors. The pharmaceuticals comprising a particle emitting radioactive metal ion are also useful for

10      treating rheumatoid arthritis by destroying the formation of angiogenic vasculature. The pharmaceuticals comprising a paramagnetic metal ion are useful as magnetic resonance imaging contrast agents. The pharmaceuticals comprising one or more X-ray absorbing or

15      "heavy" atoms of atomic number 20 or greater are useful as X-ray contrast agents. The pharmaceuticals comprising a microbubble of a biocompatible gas, a liquid carrier, and a surfactant microsphere, are useful as ultrasound contrast agents.

DETAILED DESCRIPTION OF THE INVENTION

[1] Thus, in a first embodiment, the present invention provides a novel compound, comprising: a targeting moiety and a chelator, wherein the targeting moiety is bound to the chelator, is a quinolone nonpeptide, and binds to a receptor that is upregulated during angiogenesis and the compound has 0-1 linking groups between the targeting moiety and chelator.

30

[2] In a preferred embodiment, the receptor is the integrin  $\alpha_v\beta_3$  or  $\alpha_v\beta_5$  and the compound is of the formula:  
 $(Q)_d-L_n-C_h$  or  $(Q)_d-L_n-(C_h)_d$ .

$C_h$  is a metal bonding unit having a formula selected from the group:

- 25  $A^1$ ,  $A^2$ ,  $A^3$ ,  $A^4$ ,  $A^5$ ,  $A^6$ ,  $A^7$ , and  $A^8$  are independently selected at each occurrence from the group:  $NR^{13}$ ,  $NR^{13}R^{14}$ , S, SH, S(Pg), O, OH,  $PR^{13}$ ,  $PR^{13}R^{14}$ ,  $P(O)R^{15}R^{16}$ , and a bond to  $L_n$ ;

E is a bond, CH, or a spacer group independently selected at each occurrence from the group: C<sub>1</sub>-C<sub>10</sub> alkyl substituted with 0-3 R<sup>17</sup>, aryl substituted with 0-3 R<sup>17</sup>, C<sub>3</sub>-<sub>10</sub> cycloalkyl substituted with 0-3 R<sup>17</sup>,

5 heterocyclo-C<sub>1</sub>-<sub>10</sub> alkyl substituted with 0-3 R<sup>17</sup>, wherein the heterocyclo group is a 5-10 membered heterocyclic ring system containing 1-4 heteroatoms independently selected from N, S, and O, C<sub>6</sub>-<sub>10</sub>

10 aryl-C<sub>1</sub>-<sub>10</sub> alkyl substituted with 0-3 R<sup>17</sup>, C<sub>1</sub>-<sub>10</sub> alkyl-C<sub>6</sub>-<sub>10</sub> aryl- substituted with 0-3 R<sup>17</sup>, and a 5-10 membered heterocyclic ring system containing 1-4 heteroatoms independently selected from N, S, and O and substituted with 0-3 R<sup>17</sup>;

15 R<sup>13</sup> and R<sup>14</sup> are each independently selected from the group: a bond to L<sub>n</sub>, hydrogen, C<sub>1</sub>-C<sub>10</sub> alkyl substituted with 0-3 R<sup>17</sup>, aryl substituted with 0-3 R<sup>17</sup>, C<sub>1</sub>-<sub>10</sub> cycloalkyl substituted with 0-3 R<sup>17</sup>,

20 heterocyclo-C<sub>1</sub>-<sub>10</sub> alkyl substituted with 0-3 R<sup>17</sup>, wherein the heterocyclo group is a 5-10 membered heterocyclic ring system containing 1-4 heteroatoms independently selected from N, S, and O, C<sub>6</sub>-<sub>10</sub> aryl-C<sub>1</sub>-<sub>10</sub> alkyl substituted with 0-3 R<sup>17</sup>, C<sub>1</sub>-<sub>10</sub> alkyl-C<sub>6</sub>-<sub>10</sub> aryl- substituted with 0-3 R<sup>17</sup>, a 5-10

25 membered heterocyclic ring system containing 1-4 heteroatoms independently selected from N, S, and O and substituted with 0-3 R<sup>17</sup>, and an electron, provided that when one of R<sup>13</sup> or R<sup>14</sup> is an electron, then the other is also an electron;

30 alternatively, R<sup>13</sup> and R<sup>14</sup> combine to form =C(R<sup>20</sup>)(R<sup>21</sup>);

R<sup>15</sup> and R<sup>16</sup> are each independently selected from the group: a bond to L<sub>n</sub>, -OH, C<sub>1</sub>-C<sub>10</sub> alkyl substituted with 0-3 R<sup>17</sup>, C<sub>1</sub>-C<sub>10</sub> alkyl substituted with 0-3 R<sup>17</sup>,

35 aryl substituted with 0-3 R<sup>17</sup>, C<sub>3</sub>-<sub>10</sub> cycloalkyl substituted with 0-3 R<sup>17</sup>, heterocyclo-C<sub>1</sub>-<sub>10</sub> alkyl substituted with 0-3 R<sup>17</sup>, wherein the heterocyclo

- group is a 5-10 membered heterocyclic ring system containing 1-4 heteroatoms independently selected from N, S, and O, C<sub>6</sub>-10 aryl-C<sub>1</sub>-10 alkyl substituted with 0-3 R<sup>17</sup>, C<sub>1</sub>-10 alkyl-C<sub>6</sub>-10 aryl- substituted with 0-3 R<sup>17</sup>, and a 5-10 membered heterocyclic ring system containing 1-4 heteroatoms independently selected from N, S, and O and substituted with 0-3 R<sup>17</sup>;
- 5 10 R<sup>17</sup> is independently selected at each occurrence from the group: a bond to L<sub>n</sub>, =O, F, Cl, Br, I, -CF<sub>3</sub>, -CN, -CO<sub>2</sub>R<sup>18</sup>, -C(=O)R<sup>18</sup>, -C(=O)N(R<sup>18</sup>)<sub>2</sub>, -CHO, -CH<sub>2</sub>OR<sup>18</sup>, -OC(=O)R<sup>18</sup>, -OC(=O)OR<sup>18a</sup>, -OR<sup>18</sup>, -OC(=O)N(R<sup>18</sup>)<sub>2</sub>, -NR<sup>19</sup>C(=O)R<sup>18</sup>, -NR<sup>19</sup>C(=O)OR<sup>18a</sup>, -NR<sup>19</sup>C(=O)N(R<sup>18</sup>)<sub>2</sub>, -NR<sup>19</sup>SO<sub>2</sub>N(R<sup>18</sup>)<sub>2</sub>, -NR<sup>19</sup>SO<sub>2</sub>R<sup>18a</sup>, -SO<sub>3</sub>H, -SO<sub>2</sub>R<sup>18a</sup>, -SR<sup>18</sup>, -S(=O)R<sup>18a</sup>, -SO<sub>2</sub>N(R<sup>18</sup>)<sub>2</sub>, -N(R<sup>18</sup>)<sub>2</sub>, -NHC(=S)NHR<sup>18</sup>, =NOR<sup>18</sup>, NO<sub>2</sub>, -C(=O)NHOR<sup>18</sup>, -C(=O)NHNHR<sup>18</sup>R<sup>18a</sup>, -OCH<sub>2</sub>CO<sub>2</sub>H, 2-(1-morpholino)ethoxy, C<sub>1</sub>-C<sub>5</sub> alkyl, C<sub>2</sub>-C<sub>4</sub> alkenyl, C<sub>3</sub>-C<sub>6</sub> cycloalkyl, C<sub>3</sub>-C<sub>6</sub> cycloalkylmethyl, C<sub>2</sub>-C<sub>6</sub> alkoxyalkyl, aryl substituted with 0-2 R<sup>18</sup>, and a 5-10 membered heterocyclic ring system containing 1-4 heteroatoms independently selected from N, S, and O;
- 15 20 25 30 35 R<sup>18</sup>, R<sup>18a</sup>, and R<sup>19</sup> are independently selected at each occurrence from the group: a bond to L<sub>n</sub>, H, C<sub>1</sub>-C<sub>6</sub> alkyl, phenyl, benzyl, C<sub>1</sub>-C<sub>6</sub> alkoxy, halide, nitro, cyano, and trifluoromethyl;
- Pg is a thiol protecting group;
- R<sup>20</sup> and R<sup>21</sup> are independently selected from the group: H, C<sub>1</sub>-C<sub>10</sub> alkyl, -CN, -CO<sub>2</sub>R<sup>25</sup>, -C(=O)R<sup>25</sup>, -C(=O)N(R<sup>25</sup>)<sub>2</sub>, C<sub>2</sub>-C<sub>10</sub> 1-alkene substituted with 0-3 R<sup>23</sup>, C<sub>2</sub>-C<sub>10</sub> 1-alkyne substituted with 0-3 R<sup>23</sup>, aryl substituted with 0-3 R<sup>23</sup>, unsaturated 5-10 membered heterocyclic ring system containing 1-4 heteroatoms independently selected from N, S, and O and substituted with 0-3

$R^{23}$ , and unsaturated C<sub>3</sub>-10 carbocycle substituted with 0-3  $R^{23}$ ;

5 alternatively,  $R^{20}$  and  $R^{21}$ , taken together with the  
divalent carbon radical to which they are attached  
form:

10  $R^{22}$  and  $R^{23}$  are independently selected from the group: H,  
 $R^{24}$ , C<sub>1</sub>-C<sub>10</sub> alkyl substituted with 0-3  $R^{24}$ , C<sub>2</sub>-C<sub>10</sub>  
alkenyl substituted with 0-3  $R^{24}$ , C<sub>2</sub>-C<sub>10</sub> alkynyl  
substituted with 0-3  $R^{24}$ , aryl substituted with 0-3  
 $R^{24}$ , a 5-10 membered heterocyclic ring system  
15 containing 1-4 heteroatoms independently selected  
from N, S, and O and substituted with 0-3  $R^{24}$ , and  
C<sub>3</sub>-10 carbocycle substituted with 0-3  $R^{24}$ ;

20 alternatively,  $R^{22}$ ,  $R^{23}$  taken together form a fused  
aromatic or a 5-10 membered heterocyclic ring system  
containing 1-4 heteroatoms independently selected  
from N, S, and O;

25  $a$  and  $b$  indicate the positions of optional double bonds  
and  $n$  is 0 or 1;

and a pharmaceutically acceptable salt thereof.

[41] In another more preferred embodiment, the present invention provides a novel ultrasound contrast agent  
10 composition, comprising:

(a) a compound of Claim 39, comprising: an quinolone that binds to the integrin  $\alpha_v\beta_3$ , a surfactant and a linking group between the quinolone and the surfactant;

15 (b) a parenterally acceptable carrier; and,  
(c) an echogenic gas.

[42] In another more preferred embodiment, the present invention provides a novel ultrasound contrast agent  
20 composition, further comprising: 1,2-dipalmitoyl-sn-glycero-3-phosphatidic acid, 1,2-dipalmitoyl-sn-glycero-3-phosphatidylcholine, and N-(methoxypolyethylene glycol 5000 carbamoyl)-1,2-dipalmitoyl-sn-glycero-3-phosphatidylethanolamine.

25

[43] In another more preferred embodiment, the echogenic gas is a C<sub>2</sub>-5 perfluorocarbon.

[44] In another preferred embodiment, the present  
30 invention provides a method of imaging cancer in a patient comprising: (1) administering, by injection or infusion, a ultrasound contrast agent composition of Claim 41 to a patient; and (2) imaging the patient using sonography.

35

[45] In another preferred embodiment, the present invention provides a method of imaging formation of new blood vessels in a patient comprising: (1)

administering, by injection or infusion, a ultrasound contrast agent composition of of Claim 41 to a patient; (2) imaging the area of the patient wherein the desired formation of new blood vessels is located.

5

[46] In another preferred embodiment, the present invention provides a method of imaging therapeutic angiogenesis in a patient comprising: (1) administering, by injection or infusion, an ultrasound contrast agent composition of Claim 41 to a patient; (2) imaging the area of the patient wherein the desired formation of new blood vessels is located.

[47] In another preferred embodiment, the present invention provides a method of imaging atherosclerosis in a patient comprising: (1) administering, by injection or infusion, an ultrasound contrast agent composition of Claim 41 to a patient; (2) imaging the area of the patient wherein the atherosclerosis is located.

20

[48] In another preferred embodiment, the present invention provides a method of imaging restenosis in a patient comprising: (1) administering, by injection or infusion, an ultrasound contrast agent composition of Claim 41 to a patient; (2) imaging the area of the patient wherein the restenosis is located.

[49] In another preferred embodiment, the present invention provides a method of imaging cardiac ischemia in a patient comprising: (1) administering, by injection or infusion, an ultrasound contrast agent composition of Claim 41 to a patient; (2) imaging the area of the myocardium wherein the ischemic region is located.

35 [50] In another preferred embodiment, the present invention provides a method of imaging myocardial reperfusion injury in a patient comprising: (1) administering, by injection or infusion, an ultrasound

contrast agent composition of Claim 41 to a patient; (2) imaging the area of myocardium wherein the reperfusion injury is located.

- 5 [51] In another preferred embodiment, the present invention provides a novel therapeutic radiopharmaceutical composition, comprising:
  - (a) a therapeutic radiopharmaceutical of Claim 19; and,
  - 10 (b) a parenterally acceptable carrier.

[52] In another preferred embodiment, the present invention provides a novel diagnostic pharmaceutical composition, comprising:

- 15 (a) a diagnostic radiopharmaceutical, a MRI contrast agent, or a X-ray contrast agent of Claim 11; and,
- (b) a parenterally acceptable carrier.

- 20 [53] In another preferred embodiment, the present invention provides a method of treating restenosis in a patient comprising: administering to a patient, either systemically or locally, a therapeutic radiopharmaceutical of Claim 19 capable of localizing in the restenotic area and delivering an effective dose of radiation.

- 25 [54] In another preferred embodiment, the present invention provides a method of imaging atherosclerosis in a patient comprising: (1) administering a diagnostic radiopharmaceutical, a MRI contrast agent, or a X-ray contrast agent of Claim 11 to a patient by injection or infusion; (2) imaging the area of the patient wherein the atherosclerosis is located.

- 35 [55] In another preferred embodiment, the present invention provides a method of imaging restenosis in a patient comprising: (1) administering a diagnostic radiopharmaceutical, a MRI contrast agent, or a X-ray

contrast agent of Claim 11 to a patient by injection or infusion; (2) imaging the area of the patient wherein the restenosis is located.

- 5 [56] In another preferred embodiment, the present invention provides a method of imaging cardiac ischemia in a patient comprising: (1) administering a diagnostic radiopharmaceutical, a MRI contrast agent, or a X-ray contrast agent of Claim 11 to a patient by injection or  
10 infusion; (2) imaging the area of the myocardium wherein the ischemic region is located.

- [57] In another preferred embodiment, the present invention provides a method of imaging myocardial reperfusion injury in a patient comprising: (1) administering a diagnostic radiopharmaceutical, a MRI contrast agent, or a X-ray contrast agent of Claim 11 to a patient by injection or infusion; (2) imaging the area of myocardium wherein the reperfusion injury is located.

- 20 Another aspect of the present invention are diagnostic kits for the preparation of radiopharmaceuticals useful as imaging agents for cancer. Diagnostic kits of the present invention comprise one or  
25 more vials containing the sterile, non-pyrogenic, formulation comprised of a predetermined amount of a reagent of the present invention, and optionally other components such as one or two ancillary ligands, reducing agents, transfer ligands, buffers, lyophilization aids,  
30 stabilization aids, solubilization aids and bacteriostats. The inclusion of one or more optional components in the formulation will frequently improve the ease of synthesis of the radiopharmaceutical by the practicing end user, the ease of manufacturing the kit,  
35 the shelf-life of the kit, or the stability and shelf-life of the radiopharmaceutical. The inclusion of one or two ancillary ligands is required for diagnostic kits comprising reagent comprising a hydrazine or hydrazone bonding moiety. The one or more vials that

contain all or part of the formulation can independently be in the form of a sterile solution or a lyophilized solid.

- Another aspect of the present invention contemplates  
5 a method of imaging cancer in a patient involving: (1) synthesizing a diagnostic radiopharmaceutical of the present invention, using a reagent of the present invention, capable of localizing in tumors; (2) administering said radiopharmaceutical to a patient by  
10 injection or infusion; (3) imaging the patient using planar or SPECT gamma scintigraphy, or positron emission tomography.

- Another aspect of the present invention contemplates  
15 a method of imaging cancer in a patient involving: (1) administering a paramagnetic metallopharmaceutical of the present invention capable of localizing in tumors to a patient by injection or infusion; and (2) imaging the patient using magnetic resonance imaging.

- Another aspect of the present invention contemplates  
20 a method of imaging cancer in a patient involving: (1) administering a X-ray contrast agent of the present invention capable of localizing in tumors to a patient by injection or infusion; and (2) imaging the patient using X-ray computed tomography.

- 25 Another aspect of the present invention contemplates a method of imaging cancer in a patient involving: (1) administering a ultrasound contrast agent of the present invention capable of localizing in tumors to a patient by injection or infusion; and (2) imaging the patient using sonography.

- Another aspect of the present invention contemplates a method of treating cancer in a patient involving: (1) administering a therapeutic radiopharmaceutical of the present invention capable of localizing in tumors to a  
35 patient by injection or infusion.

DEFINITIONS

The compounds herein described may have asymmetric centers. Unless otherwise indicated, all chiral, 5 diastereomeric and racemic forms are included in the present invention. Many geometric isomers of olefins, C=N double bonds, and the like can also be present in the compounds described herein, and all such stable isomers are contemplated in the present invention. It will be 10 appreciated that compounds of the present invention contain asymmetrically substituted carbon atoms, and may be isolated in optically active or racemic forms. It is well known in the art how to prepare optically active forms, such as by resolution of racemic forms or by 15 synthesis from optically active starting materials. Two distinct isomers (cis and trans) of the peptide bond are known to occur; both can also be present in the compounds described herein, and all such stable isomers are contemplated in the present invention. The D and 20 L-isomers of a particular amino acid are designated herein using the conventional 3-letter abbreviation of the amino acid, as indicated by the following examples: D-Leu, or L-Leu.

When any variable occurs more than one time in any 25 substituent or in any formula, its definition on each occurrence is independent of its definition at every other occurrence. Thus, for example, if a group is shown to be substituted with 0-2 R<sup>52</sup>, then said group may optionally be substituted with up to two R<sup>52</sup>, and R<sup>52</sup> at 30 each occurrence is selected independently from the defined list of possible R<sup>52</sup>. Also, by way of example, for the group -N(R<sup>53</sup>)<sub>2</sub>, each of the two R<sup>53</sup> substituents on N is independently selected from the defined list of possible R<sup>53</sup>. Combinations of substituents and/or 35 variables are permissible only if such combinations result in stable compounds. When a bond to a substituent is shown to cross the bond connecting two atoms in a

ring, then such substituent may be bonded to any atom on the ring.

- The term "nonpeptide" means preferably less than three amide bonds in the backbone core of the targeting moiety or preferably less than three amino acids or amino acid mimetics in the targeting moiety.
- 5

- The term "metallopharmaceutical" means a pharmaceutical comprising a metal. The metal is the cause of the imageable signal in diagnostic applications and 10 the source of the cytotoxic radiation in radiotherapeutic applications. Radiopharmaceuticals are metallopharmaceuticals in which the metal is a radioisotope.

- By "reagent" is meant a compound of this invention 15 capable of direct transformation into a metallopharmaceutical of this invention. Reagents may be utilized directly for the preparation of the metallopharmaceuticals of this invention or may be a component in a kit of this invention.

- 20 The term "binding agent" means a metallopharmaceutical of this invention having affinity for and capable of binding to the vitronectin receptor. The binding agents of this invention have  $K_i < 1000\text{nM}$ .

- By "stable compound" or "stable structure" is meant 25 herein a compound that is sufficiently robust to survive isolation to a useful degree of purity from a reaction mixture, and formulation into an efficacious pharmaceutical agent.

- The term "substituted", as used herein, means that 30 one or more hydrogens on the designated atom or group is replaced with a selection from the indicated group, provided that the designated atom's or group's normal valency is not exceeded, and that the substitution results in a stable compound. When a substituent is keto 35 (i.e., =O), then 2 hydrogens on the atom are replaced.

The term "bond", as used herein, means either a single or double bond.

The term "salt", as used herein, is used as defined in the CRC Handbook of Chemistry and Physics, 65th

- Edition, CRC Press, Boca Raton, Fla, 1984, as any substance which yields ions, other than hydrogen or hydroxyl ions. As used herein, "pharmaceutically acceptable salts" refer to derivatives of the disclosed compounds modified by making acid or base salts.
- Examples of pharmaceutically acceptable salts include, but are not limited to, mineral or organic acid salts of basic residues such as amines; alkali or organic salts of acidic residues such as carboxylic acids; and the like.
- The phrase "pharmaceutically acceptable" is employed herein to refer to those compounds, materials, compositions, and/or dosage forms which are, within the scope of sound medical judgment, suitable for use in contact with the tissues of human beings and animals without excessive toxicity, irritation, allergic response, or other problem or complication, commensurate with a reasonable benefit/risk ratio.
- As used herein, "pharmaceutically acceptable salts" refer to derivatives of the disclosed compounds wherein the parent compound is modified by making acid or base salts thereof. Examples of pharmaceutically acceptable salts include, but are not limited to, mineral or organic acid salts of basic residues such as amines; alkali or organic salts of acidic residues such as carboxylic acids; and the like. The pharmaceutically acceptable salts include the conventional non-toxic salts or the quaternary ammonium salts of the parent compound formed, for example, from non-toxic inorganic or organic acids. For example, such conventional non-toxic salts include those derived from inorganic acids such as hydrochloric, hydrobromic, sulfuric, sulfamic, phosphoric, nitric and the like; and the salts prepared from organic acids such as acetic, propionic, succinic, glycolic, stearic, lactic, tartaric, citric, ascorbic, pamoic, maleic, hydroxymaleic, phenylacetic, glutamic, benzoic, salicylic, sulfanilic, 2-acetoxybenzoic, fumaric, toluenesulfonic, methanesulfonic, ethane disulfonic, oxalic, isethionic, and the like.

The pharmaceutically acceptable salts of the present invention can be synthesized from the parent compound which contains a basic or acidic moiety by conventional chemical methods. Generally, such salts can be prepared  
5 by reacting the free acid or base forms of these compounds with a stoichiometric amount of the appropriate base or acid in water or in an organic solvent, or in a mixture of the two; generally, nonaqueous media like ether, ethyl acetate, ethanol, isopropanol, or  
10 acetonitrile are preferred. Lists of suitable salts are found in *Remington's Pharmaceutical Sciences*, 17th ed., Mack Publishing Company, Easton, PA, 1985, p. 1418, the disclosure of which is hereby incorporated by reference.

As used herein, "alkyl" is intended to include both  
15 branched and straight-chain saturated aliphatic hydrocarbon groups having the specified number of carbon atoms, examples of which include, but are not limited to, methyl, ethyl, n-propyl, i-propyl, n-butyl, i-butyl, sec-butyl, t-butyl, pentyl, hexyl, heptyl, octyl, nonyl,  
20 and decyl; "cycloalkyl" or "carbocycle" is intended to include saturated and partially unsaturated ring groups, including mono-, bi- or poly-cyclic ring systems, such as cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, cycloheptyl, cyclooctyl and adamantyl; "bicycloalkyl" or  
25 "bicyclic" is intended to include saturated bicyclic ring groups such as [3.3.0]bicyclooctane, [4.3.0]bicyclononane, [4.4.0]bicyclodecane (decalin), [2.2.2]bicyclooctane, and so forth.

As used herein, the term "alkene" or "alkenyl" is  
30 intended to include hydrocarbon chains having the specified number of carbon atoms of either a straight or branched configuration and one or more unsaturated carbon-carbon bonds which may occur in any stable point along the chain, such as ethenyl, propenyl, and the like.

35 As used herein, the term "alkyne" or "alkynyl" is intended to include hydrocarbon chains having the specified number of carbon atoms of either a straight or branched configuration and one or more unsaturated

carbon-carbon triple bonds which may occur in any stable point along the chain, such as propargyl, and the like.

As used herein, "aryl" or "aromatic residue" is intended to mean phenyl or naphthyl, which when

5 substituted, the substitution can be at any position.

As used herein, the term "heterocycle" or "heterocyclic system" is intended to mean a stable 5- to 7- membered monocyclic or bicyclic or 7- to 10-membered bicyclic heterocyclic ring which is saturated partially

10 unsaturated or unsaturated (aromatic), and which consists of carbon atoms and from 1 to 4 heteroatoms independently selected from the group consisting of N, O and S and including any bicyclic group in which any of the above-defined heterocyclic rings is fused to a benzene

15 ring. The nitrogen and sulfur heteroatoms may optionally be oxidized. The heterocyclic ring may be attached to its pendant group at any heteroatom or carbon atom which results in a stable structure. The heterocyclic rings described herein may be substituted on carbon or on a

20 nitrogen atom if the resulting compound is stable. If specifically noted, a nitrogen in the heterocycle may optionally be quaternized. It is preferred that when the total number of S and O atoms in the heterocycle exceeds 1, then these heteroatoms are not adjacent to one

25 another. It is preferred that the total number of S and O atoms in the heterocycle is not more than 1. As used herein, the term "aromatic heterocyclic system" is intended to mean a stable 5- to 7- membered monocyclic or bicyclic or 7- to 10-membered bicyclic heterocyclic

30 aromatic ring which consists of carbon atoms and from 1 to 4 heteroatoms independently selected from the group consisting of N, O and S. It is preferred that the total number of S and O atoms in the aromatic heterocycle is not more than 1.

35 Examples of heterocycles include, but are not limited to, 1H-indazole, 2-pyrrolidonyl, 2H,6H-1,5,2-dithiazinyl, 2H-pyrrolyl, 3H-indolyl, 4-piperidonyl, 4aH-carbazole, 4H-quinolizinyl, 6H-1,2,5-thiadiazinyl, acridinyl, azocinyl,

benzimidazolyl, benzofuranyl, benzothiofuranyl,  
benzothiophenyl, benzoxazolyl, benzthiazolyl,  
benztriazolyl, benztetrazolyl, benzisoxazolyl,  
benzisothiazolyl, benzimidazalonyl, carbazolyl,  
5 4aH-carbazolyl, -carbolinyl, chromanyl, chromenyl,  
cinnolinyl, decahydroquinolinyl, 2H,6H-1,5,2-dithiazinyl,  
dihydrofuro[2,3-*b*]tetrahydrofuran, furanyl, furazanyl,  
imidazolidinyl, imidazolinyl, imidazolyl, 1*H*-indazolyl,  
indolenyl, indolinyl, indolizinyl, indolyl,  
10 isobenzofuranyl, isochromanyl, isoindazolyl,  
isoindolinyl, isoindolyl, isoquinolinyl, isothiazolyl,  
isoxazolyl, morpholinyl, naphthyridinyl,  
octahydroisoquinolinyl, oxadiazolyl, 1,2,3-oxadiazolyl,  
1,2,4-oxadiazolyl, 1,2,5-oxadiazolyl, 1,3,4-oxadiazolyl,  
15 oxazolidinyl, oxazolyl, oxazolidinylperimidinyl,  
phenanthridinyl, phenanthrolinyl, phenarsazinyl,  
phenazinyl, phenothiazinyl, phenoxythiinyl, phenoazinyl,  
phthalazinyl, piperazinyl, piperidinyl, pteridinyl,  
piperidonyl, 4-piperidonyl, pteridinyl, purinyl, pyranyl,  
20 pyrazinyl, pyrazolidinyl, pyrazolinyl, pyrazolyl,  
pyridazinyl, pyridoaxazole, pyridoimidazole,  
pyridothiazole, pyridinyl, pyridyl, pyrimidinyl,  
pyrrolidinyl, pyrrolinyl, pyrrolyl, quinazolinyl,  
quinolinyl, 4*H*-quinolizinyl, quinoxalinyl, quinuclidinyl,  
25 carbolinyl, tetrahydrofuranyl, tetrahydroisoquinolinyl,  
tetrahydroquinolinyl, 6*H*-1,2,5-thiadiazinyl,  
1,2,3-thiadiazolyl, 1,2,4-thiadiazolyl,  
1,2,5-thiadiazolyl, 1,3,4-thiadiazolyl, thianthrenyl,  
thiazolyl, thienyl, thienothiazolyl, thienooxazolyl,  
30 thienoimidazolyl, thiophenyl, triazinyl, 1,2,3-triazolyl,  
1,2,4-triazolyl, 1,2,5-triazolyl, 1,3,4-triazolyl,  
xanthenyl. Preferred heterocycles include, but are not  
limited to, pyridinyl, furanyl, thienyl, pyrrolyl,  
pyrazolyl, imidazolyl, indolyl, benzimidazolyl,  
35 1*H*-indazolyl, oxazolidinyl, benzotriazolyl,  
benzisoxazolyl, oxindolyl, benzoxazolinyl, or isatinoyl.  
Also included are fused ring and spiro compounds  
containing, for example, the above heterocycles.

As used herein, the term "alkaryl" means an aryl group bearing an alkyl group of 1-10 carbon atoms; the term "aralkyl" means an alkyl group of 1-10 carbon atoms bearing an aryl group; the term "arylalkaryl" means an 5 aryl group bearing an alkyl group of 1-10 carbon atoms bearing an aryl group; and the term "heterocycloalkyl" means an alkyl group of 1-10 carbon atoms bearing a heterocycle.

A "polyalkylene glycol" is a polyethylene glycol, 10 polypropylene glycol or polybutylene glycol having a molecular weight of less than about 5000, terminating in either a hydroxy or alkyl ether moiety.

A "carbohydrate" is a polyhydroxy aldehyde, ketone, alcohol or acid, or derivatives thereof, including 15 polymers thereof having polymeric linkages of the acetal type.

A "cyclodextrin" is a cyclic oligosaccharide. Examples of cyclodextrins include, but are not limited to,  $\alpha$ -cyclodextrin, hydroxyethyl- $\alpha$ -cyclodextrin, 20 hydroxypropyl- $\alpha$ -cyclodextrin,  $\beta$ -cyclodextrin, hydroxypropyl- $\beta$ -cyclodextrin, carboxymethyl- $\beta$ -cyclodextrin, dihydroxypropyl- $\beta$ -cyclodextrin, hydroxyethyl- $\beta$ -cyclodextrin, 2,6 25 di-O-methyl- $\beta$ -cyclodextrin, sulfated- $\beta$ -cyclodextrin,  $\gamma$ -cyclodextrin, hydroxypropyl- $\gamma$ -cyclodextrin, dihydroxypropyl- $\gamma$ -cyclodextrin, hydroxyethyl- $\gamma$ -cyclodextrin, and sulfated  $\gamma$ -cyclodextrin.

As used herein, the term "polycarboxyalkyl" means an 30 alkyl group having between two and about 100 carbon atoms and a plurality of carboxyl substituents; and the term "polyazaalkyl" means a linear or branched alkyl group having between two and about 100 carbon atoms, interrupted by or substituted with a plurality of amine 35 groups.

A "reducing agent" is a compound that reacts with a radionuclide, which is typically obtained as a relatively unreactive, high oxidation state compound, to lower its oxidation state by transferring electron(s) to the

5 radionuclide, thereby making it more reactive. Reducing agents useful in the preparation of radiopharmaceuticals and in diagnostic kits useful for the preparation of said radiopharmaceuticals include but are not limited to stannous chloride, stannous fluoride, formamidine

10 sulfenic acid, ascorbic acid, cysteine, phosphines, and cuprous or ferrous salts. Other reducing agents are described in Brodack et. al., PCT Application 94/22496, which is incorporated herein by reference.

A "transfer ligand" is a ligand that forms an intermediate complex with a metal ion that is stable enough to prevent unwanted side-reactions but labile enough to be converted to a metallopharmaceutical. The formation of the intermediate complex is kinetically favored while the formation of the metallopharmaceutical is thermodynamically favored. Transfer ligands useful in the preparation of metallopharmaceuticals and in diagnostic kits useful for the preparation of diagnostic radiopharmaceuticals include but are not limited to gluconate, glucoheptonate, mannitol, glucarate,

20 25 N,N,N',N"-ethylenediaminetetraacetic acid, pyrophosphate and methylenediphosphonate. In general, transfer ligands are comprised of oxygen or nitrogen donor atoms.

The term "donor atom" refers to the atom directly attached to a metal by a chemical bond.

30 "Ancillary" or "co-ligands" are ligands that are incorporated into a radiopharmaceutical during its synthesis. They serve to complete the coordination sphere of the radionuclide together with the chelator or radionuclide bonding unit of the reagent. For

35 radiopharmaceuticals comprised of a binary ligand system, the radionuclide coordination sphere is composed of one or more chelators or bonding units from one or more reagents and one or more ancillary or co-ligands, provided that there are a total of two types of ligands,

chelators or bonding units. For example, a radiopharmaceutical comprised of one chelator or bonding unit from one reagent and two of the same ancillary or co-ligands and a radiopharmaceutical comprised of two chelators or bonding units from one or two reagents and one ancillary or co-ligand are both considered to be comprised of binary ligand systems. For radiopharmaceuticals comprised of a ternary ligand system, the radionuclide coordination sphere is composed of one or more chelators or bonding units from one or more reagents and one or more of two different types of ancillary or co-ligands, provided that there are a total of three types of ligands, chelators or bonding units. For example, a radiopharmaceutical comprised of one chelator or bonding unit from one reagent and two different ancillary or co-ligands is considered to be comprised of a ternary ligand system.

Ancillary or co-ligands useful in the preparation of radiopharmaceuticals and in diagnostic kits useful for the preparation of said radiopharmaceuticals are comprised of one or more oxygen, nitrogen, carbon, sulfur, phosphorus, arsenic, selenium, and tellurium donor atoms. A ligand can be a transfer ligand in the synthesis of a radiopharmaceutical and also serve as an ancillary or co-ligand in another radiopharmaceutical. Whether a ligand is termed a transfer or ancillary or co-ligand depends on whether the ligand remains in the radionuclide coordination sphere in the radiopharmaceutical, which is determined by the coordination chemistry of the radionuclide and the chelator or bonding unit of the reagent or reagents.

A "chelator" or "bonding unit" is the moiety or group on a reagent that binds to a metal ion through the formation of chemical bonds with one or more donor atoms. The term "binding site" means the site in vivo or in vitro that binds a biologically active molecule.

A "diagnostic kit" or "kit" comprises a collection of components, termed the formulation, in one or more vials which are used by the practicing end user in a

clinical or pharmacy setting to synthesize diagnostic radiopharmaceuticals. The kit provides all the requisite components to synthesize and use the diagnostic radiopharmaceutical except those that are commonly 5 available to the practicing end user, such as water or saline for injection, a solution of the radionuclide, equipment for heating the kit during the synthesis of the radiopharmaceutical, if required, equipment necessary for administering the radiopharmaceutical to the patient such 10 as syringes and shielding, and imaging equipment.

Therapeutic radiopharmaceuticals, X-ray contrast agent pharmaceuticals, ultrasound contrast agent pharmaceuticals and metallopharmaceuticals for magnetic resonance imaging contrast are provided to the end user 15 in their final form in a formulation contained typically in one vial, as either a lyophilized solid or an aqueous solution. The end user reconstitutes the lyophilized with water or saline and withdraws the patient dose or just withdraws the dose from the aqueous solution 20 formulation as provided.

A "lyophilization aid" is a component that has favorable physical properties for lyophilization, such as the glass transition temperature, and is added to the formulation to improve the physical properties of the 25 combination of all the components of the formulation for lyophilization.

A "stabilization aid" is a component that is added to the metallopharmaceutical or to the diagnostic kit either to stabilize the metallopharmaceutical or to 30 prolong the shelf-life of the kit before it must be used. Stabilization aids can be antioxidants, reducing agents or radical scavengers and can provide improved stability by reacting preferentially with species that degrade other components or the metallopharmaceutical.

35 A "solubilization aid" is a component that improves the solubility of one or more other components in the medium required for the formulation.

A "bacteriostat" is a component that inhibits the growth of bacteria in a formulation either during its

storage before use or after a diagnostic kit is used to synthesize a radiopharmaceutical.

30 As used herein, the term "bubbles", as used herein, refers to vesicles which are generally characterized by the presence of one or more membranes or walls surrounding an internal void that is filled with a gas or precursor thereto. Exemplary bubbles include, for 35 example, liposomes, micelles and the like.

As used herein, the term "lipid" refers to a synthetic or naturally-occurring amphipathic compound which comprises a hydrophilic component and a hydrophobic component. Lipids include, for example, fatty acids,

neutral fats, phosphatides, glycolipids, aliphatic alcohols and waxes, terpenes and steroids.

As used herein, the term "lipid composition" refers to a composition which comprises a lipid compound.

- 5 Exemplary lipid compositions include suspensions, emulsions and vesicular compositions.

As used herein, the term "lipid formulation" refers to a composition which comprises a lipid compound and a bioactive agent.

- 10 As used herein, the term "vesicle" refers to a spherical entity which is characterized by the presence of an internal void. Preferred vesicles are formulated from lipids, including the various lipids described herein. In any given vesicle, the lipids may be in the form of a monolayer or bilayer, and the mono- or bilayer lipids may be used to form one or more mono- or bilayers. In the case of more than one mono- or bilayer, the mono- or bilayers are generally concentric. The lipid vesicles described herein include such entities commonly referred 15 to as liposomes, micelles, bubbles, microbubbles, microspheres and the like. Thus, the lipids may be used to form a unilamellar vesicle (comprised of one monolayer or bilayer), an oligolamellar vesicle (comprised of about two or about three monolayers or bilayers) or a 20 multilamellar vesicle (comprised of more than about three monolayers or bilayers). The internal void of the vesicles may be filled with a liquid, including, for example, an aqueous liquid, a gas, a gaseous precursor, and/or a solid or solute material, including, for 25 example, a bioactive agent, as desired.

As used herein, the term "vesicular composition" refers to a composition which is formulate from lipids and which comprises vesicles.

- 30 As used herein, the term "vesicle formulation" refers to a composition which comprises vesicles and a bioactive agent.

As used herein, the term "lipsomes" refers to a generally spherical cluster or aggregate of amphipathic compounds, including lipid compounds, typically in the

form of one or more concentric layers, for example, bilayers. They may also be referred to herein as lipid vesicles.

Angiogenesis is the process of formation of new capillary blood vessels from existing vasculature. It is an important component of a variety of physiological processes including ovulation, embryonic development, wound repair, and collateral vascular generation in the myocardium. It is also central to a number of pathological conditions such as tumor growth and metastasis, diabetic retinopathy, and macular degeneration. The process begins with the activation of existing vascular endothelial cells in response to a variety of cytokines and growth factors. The activated endothelial cells secrete enzymes that degrade the basement membrane of the vessels. The endothelial cells then proliferate and migrate into the extracellular matrix first forming tubules and subsequently new blood vessels.

Under normal conditions, endothelial cell proliferation is a very slow process, but it increases for a short period of time during embryogenesis, ovulation and wound healing. This temporary increase in cell turnover is governed by a combination of a number of growth stimulatory factors and growth suppressing factors. In pathological angiogenesis, this normal balance is disrupted resulting in continued increased endothelial cell proliferation. Some of the pro-angiogenic factors that have been identified include basic fibroblast growth factor (bFGF), angiogenin, TGF-alpha, TGF-beta, and vascular endothelium growth factor (VEGF), while interferon-alpha, interferon-beta and thrombospondin are examples of angiogenesis suppressors.

Angiogenic factors interact with endothelial cell surface receptors such as the receptor tyrosine kinases EGFR, FGFR, PDGFR, Flk-1/KDR, Flt-1, Tek, Tie, neuropilin-1, endoglin, endosialin, and Axl. The receptors Flk-1/KDR, neuropilin-1, and Flt-1 recognize VEGF and these interactions play key roles in VEGF-

induced angiogenesis. The Tie subfamily of receptor tyrosine kinases are also expressed prominently during blood vessel formation.

The proliferation and migration of endothelial cells  
5 in the extracellular matrix is mediated by interaction  
with a variety of cell adhesion molecules. Integrins are  
a diverse family of heterodimeric cell surface receptors  
by which endothelial cells attach to the extracellular  
matrix, each other and other cells. Angiogenesis induced  
10 by bFGF or TNF-alpha depend on the agency of the integrin  
avb3, while angiogenesis induced by VEGF depends on the  
integrin avb5 (Cheresh et. al., Science, 1995, 270, 1500-  
2). Induction of expression of the integrins a1b1 and  
15 a2b1 on the endothelial cell surface is another important  
mechanism by which VEGF promotes angiogenesis (Senger,  
et. al., Proc. Natl. Acad. Sci USA, 1997, 94, 13612-7).

The pharmaceuticals of the present invention are  
comprised of a non-peptide targeting moiety for the  
vitronectin receptor that is expressed or upregulated in  
20 angiogenic tumor vasculature.

The ultrasound contrast agents of the present  
invention comprise a plurality of vitronectin receptor  
targeting moieties attached to or incorporated into a  
25 microbubble of a biocompatible gas, a liquid carrier, and  
a surfactant microsphere, further comprising an optional  
linking moiety, L<sub>n</sub>, between the targeting moieties and  
the microbubble. In this context, the term liquid  
carrier means aqueous solution and the term surfactant  
30 means any amphiphilic material which produces a reduction  
in interfacial tension in a solution. A list of suitable  
surfactants for forming surfactant microspheres is  
disclosed in EP0727225A2, herein incorporated by  
reference. The term surfactant microsphere includes  
35 nanospheres, liposomes, vesicles and the like. The  
biocompatible gas can be air, or a fluorocarbon, such as  
a C<sub>3</sub>-C<sub>5</sub> perfluoroalkane, which provides the difference in  
echogenicity and thus the contrast in ultrasound imaging.

The gas is encapsulated or contained in the microsphere to which is attached the biodirecting group, optionally via a linking group. The attachment can be covalent, ionic or by van der Waals forces. Specific examples of 5 such contrast agents include lipid encapsulated perfluorocarbons with a plurality of tumor neovasculature receptor binding peptides, polypeptides or peptidomimetics.

X-ray contrast agents of the present invention are 10 comprised of one or more vitronectin receptor targeting moieties attached to one or more X-ray absorbing or "heavy" atoms of atomic number 20 or greater, further comprising an optional linking moiety,  $L_n$ , between the targeting moieties and the X-ray absorbing atoms. The 15 frequently used heavy atom in X-ray contrast agents is iodine. Recently, X-ray contrast agents comprised of metal chelates (Wallace, R., U.S. 5,417,959) and polychelates comprised of a plurality of metal ions (Love, D., U.S. 5,679,810) have been disclosed. More 20 recently, multinuclear cluster complexes have been disclosed as X-ray contrast agents (U.S. 5,804,161, PCT WO91/14460, and PCT WO 92/17215).

MRI contrast agents of the present invention are comprised of one or more vitronectin receptor targeting 25 moieties attached to one or more paramagnetic metal ions, further comprising an optional linking moiety,  $L_n$ , between the targeting moieties and the paramagnetic metal ions. The paramagnetic metal ions are present in the form of metal complexes or metal oxide particles. U.S. 30 5,412,148, and 5,760,191, describe examples of chelators for paramagnetic metal ions for use in MRI contrast agents. U.S. 5,801,228, U.S. 5,567,411, and U.S. 5,281,704, describe examples of polychelants useful for complexing more than one paramagnetic metal ion for use 35 in MRI contrast agents. U.S. 5,520,904, describes particulate compositions comprised of paramagnetic metal ions for use as MRI contrast agents.

The pharmaceuticals of the present invention have the formulae,  $(Q)_d-L_n-(C_h-X)$ ,  $(Q)_d-L_n-(C_h-X^1)_d$ ,  $(Q)_d-L_n-(X^2)_d$ , and  $(Q)_d-L_n-(X^3)$ , wherein Q represents a non-peptide that binds to a receptor expressed in  
5 angiogenic tumor vasculature, d is 1-10,  $L_n$  represents an optional linking group,  $C_h$  represents a metal chelator or bonding moiety, X represents a radioisotope,  $X^1$  represents paramagnetic metal ion,  $X^2$  represents a paramagnetic metal ion or heavy atom containing insoluble  
10 solid particle,  $d^*$  is 1-100, and  $X^3$  represents a surfactant microsphere of an echogenic gas. The interaction of the non-peptide recognition sequences of the vitronectin receptor binding portion of the pharmaceuticals with the  $\alpha v \beta 3$  receptor results in  
15 localization of the pharmaceuticals in angiogenic tumor vasculature, which express the  $\alpha v \beta 3$  receptor.

The pharmaceuticals of the present invention can be synthesized by several approaches. One approach involves the synthesis of the targeting non-peptide moiety, Q, and  
20 direct attachment of one or more moieties, Q, to one or more metal chelators or bonding moieties,  $C_h$ , or to a paramagnetic metal ion or heavy atom containing solid particle, or to an echogenic gas microbubble. Another approach involves the attachment of one or more moieties,  
25 Q, to the linking group,  $L_n$ , which is then attached to one or more metal chelators or bonding moieties,  $C_h$ , or to a paramagnetic metal ion or heavy atom containing solid particle, or to an echogenic gas microbubble.  
Another approach involves the synthesis of a non-peptide,  
30 Q, bearing a fragment of the linking group,  $L_n$ , one or more of which are then attached to the remainder of the linking group and then to one or more metal chelators or bonding moieties,  $C_h$ , or to a paramagnetic metal ion or heavy atom containing solid particle, or to an echogenic gas microbubble.  
35

The non-peptide vitronectin binding moieties, Q, optionally bearing a linking group,  $L_n$ , or a fragment of

the linking group, can be synthesized using standard synthetic methods known to those skilled in the art. Preferred methods include but are not limited to those methods described below.

- 5      The attachment of linking groups,  $L_n$ , to the non-peptides, Q; chelators or bonding units,  $C_h$ , to the non-peptides, Q, or to the linking groups,  $L_n$ ; and non-peptides, bearing a fragment of the linking group to the remainder of the linking group, in combination forming
- 10     the moiety,  $(Q)_d-L_n$ , and then to the moiety  $C_h$ ; can all be performed by standard techniques. These include, but are not limited to, amidation, esterification, alkylation, and the formation of ureas or thioureas. Procedures for performing these attachments can be found in Brinkley, M., *Bioconjugate Chemistry* 1992, 3(1), which is incorporated herein by reference.
- 15     15

A number of methods can be used to attach the non-peptides, Q, to paramagnetic metal ion or heavy atom containing solid particles,  $X^2$ , by one of skill in the art of the surface modification of solid particles. In general, the targeting moiety Q or the combination  $(Q)_dL_n$  is attached to a coupling group that react with a constituent of the surface of the solid particle. The coupling groups can be any of a number of silanes which react with surface hydroxyl groups on the solid particle surface, as described in co-pending United States Patent Application Serial No. 09/356,178, and can also include polyphosphonates, polycarboxylates, polyphosphates or mixtures thereof which couple with the surface of the solid particles, as described in U.S. 5,520,904.

A number of reaction schemes can be used to attach the non-peptides, Q, to the surfactant microsphere,  $X^3$ . These are illustrated in following reaction schemes where  $S_f$  represents a surfactant moiety that forms the surfactant microsphere.

Acylation Reaction:

## 5 Disulfide Coupling:

## Sulfonamide Coupling:

## Reductive Amidation:

In these reaction schemes, the substituents  $S_f$  and  $Q$  can  
20 be reversed as well.

The linking group  $L_n$  can serve several roles. First it provides a spacing group between the metal chelator or bonding moiety,  $C_h$ , the paramagnetic metal ion or heavy atom containing solid particle,  $X^2$ , and the surfactant microsphere,  $X^3$ , and the one or more of the non-peptides,  $Q$ , so as to minimize the possibility that the moieties  $C_h-X$ ,  $C_h-X^1$ ,  $X^2$ , and  $X^3$ , will interfere with the interaction of the recognition sequences of  $Q$  with angiogenic tumor vasculature receptors. The necessity of incorporating a linking group in a reagent is dependent on the identity of  $Q$ ,  $C_h-X$ ,  $C_h-X^1$ ,  $X^2$ , and  $X^3$ . If  $C_h-X$ ,  $C_h-X^1$ ,  $X^2$ , and  $X^3$ , cannot be attached to  $Q$  without substantially diminishing its affinity for the receptors, then a linking group is used. A linking group also provides a means of independently attaching multiple non-peptides,  $Q$ , to one group that is attached to  $C_h-X$ ,  $C_h-X^1$ ,  $X^2$ , or  $X^3$ .

The linking group also provides a means of incorporating a pharmacokinetic modifier into the pharmaceuticals of the present invention. The pharmacokinetic modifier serves to direct the biodistribution of the injected pharmaceutical other than by the interaction of the targeting moieties, Q, with the vitronectin receptors expressed in the tumor neovasculature. A wide variety of functional groups can serve as pharmacokinetic modifiers, including, but not limited to, carbohydrates, polyalkylene glycols, peptides or other polyamino acids, and cyclodextrins. The modifiers can be used to enhance or decrease hydrophilicity and to enhance or decrease the rate of blood clearance. The modifiers can also be used to direct the route of elimination of the pharmaceuticals. Preferred pharmacokinetic modifiers are those that result in moderate to fast blood clearance and enhanced renal excretion.

The metal chelator or bonding moiety, Ch, is selected to form stable complexes with the metal ion chosen for the particular application. Chelators or bonding moieties for diagnostic radiopharmaceuticals are selected to form stable complexes with the radioisotopes that have imageable gamma ray or positron emissions, such as <sup>99m</sup>Tc, <sup>95</sup>Tc, <sup>111</sup>In, <sup>62</sup>Cu, <sup>60</sup>Cu, <sup>64</sup>Cu, <sup>67</sup>Ga, <sup>68</sup>Ga, <sup>86</sup>Y.

Chelators for technetium, copper and gallium isotopes are selected from diaminedithiols, monoamine-monoamidedithiols, triamide-monothiols, monoamine-diamide-monothiols, diaminedioximes, and hydrazines. The chelators are generally tetradentate with donor atoms selected from nitrogen, oxygen and sulfur. Preferred reagents are comprised of chelators having amine nitrogen and thiol sulfur donor atoms and hydrazine bonding units. The thiol sulfur atoms and the hydrazines may bear a protecting group which can be displaced either prior to using the reagent to synthesize a radiopharmaceutical or preferably in situ during the synthesis of the radiopharmaceutical.

- Exemplary thiol protecting groups include those listed in Greene and Wuts, "Protective Groups in Organic Synthesis" John Wiley & Sons, New York (1991), the disclosure of which is hereby incorporated by reference.
- 5 Any thiol protecting group known in the art can be used. Examples of thiol protecting groups include, but are not limited to, the following: acetamidomethyl, benzamidomethyl, 1-ethoxyethyl, benzoyl, and triphenylmethyl.
- 10 Exemplary protecting groups for hydrazine bonding units are hydrazone which can be aldehyde or ketone hydrazone having substituents selected from hydrogen, alkyl, aryl and heterocycle. Particularly preferred hydrazone are described in co-pending U.S.S.N. 15 08/476,296 the disclosure of which is herein incorporated by reference in its entirety.

The hydrazine bonding unit when bound to a metal radionuclide is termed a hydrazido, or diazenido group and serves as the point of attachment of the radionuclide 20 to the remainder of the radiopharmaceutical. A diazenido group can be either terminal (only one atom of the group is bound to the radionuclide) or chelating. In order to have a chelating diazenido group at least one other atom of the group must also be bound to the radionuclide. The 25 atoms bound to the metal are termed donor atoms.

Chelators for  $^{111}\text{In}$  and  $^{86}\text{Y}$  are selected from cyclic and acyclic polyaminocarboxylates such as DTPA, DOTA, DO3A, 2-benzyl-DOTA, alpha-(2-phenethyl)-1,4,7,10-tetraazacyclododecane-1-acetic-4,7,10-30 tris(methylacetic)acid, 2-benzyl-cyclohexyldiethylenetriaminepentaacetic acid, 2-benzyl-6-methyl-DTPA, and 6,6"-bis[N,N,N",N"-tetra(carboxymethyl)aminomethyl]-4'-(3-amino-4-methoxyphenyl)-2,2':6',2"-terpyridine. Procedures for 35 synthesizing these chelators that are not commercially available can be found in Brechbiel, M. and Gansow, O., *J. Chem. Soc. Perkin Trans. 1992, 1, 1175*; Brechbiel, M. and Gansow, O., *Bioconjugate Chem. 1991, 2, 187*; Deshpande, S., et. al., *J. Nucl. Med. 1990, 31, 473*;

Kruper, J., U.S. Patent 5,064,956, and Toner, J., U.S. Patent 4,859,777, the disclosures of which are hereby incorporated by reference in their entirety.

The coordination sphere of metal ion includes all 5 the ligands or groups bound to the metal. For a transition metal radionuclide to be stable it typically has a coordination number (number of donor atoms) comprised of an integer greater than or equal to 4 and less than or equal to 8; that is there are 4 to 8 atoms 10 bound to the metal and it is said to have a complete coordination sphere. The requisite coordination number for a stable radionuclide complex is determined by the identity of the radionuclide, its oxidation state, and the type of donor atoms. If the chelator or bonding unit 15 does not provide all of the atoms necessary to stabilize the metal radionuclide by completing its coordination sphere, the coordination sphere is completed by donor atoms from other ligands, termed ancillary or co-ligands, which can also be either terminal or chelating.

20 A large number of ligands can serve as ancillary or co-ligands, the choice of which is determined by a variety of considerations such as the ease of synthesis of the radiopharmaceutical, the chemical and physical properties of the ancillary ligand, the rate of 25 formation, the yield, and the number of isomeric forms of the resulting radiopharmaceuticals, the ability to administer said ancillary or co-ligand to a patient without adverse physiological consequences to said patient, and the compatibility of the ligand in a 30 lyophilized kit formulation. The charge and lipophilicity of the ancillary ligand will effect the charge and lipophilicity of the radiopharmaceuticals. For example, the use of 4,5-dihydroxy-1,3-benzene 35 disulfonate results in radiopharmaceuticals with an additional two anionic groups because the sulfonate groups will be anionic under physiological conditions. The use of N-alkyl substituted 3,4-hydroxypyridinones results in radiopharmaceuticals with varying degrees of

lipophilicity depending on the size of the alkyl substituents.

- Preferred technetium radiopharmaceuticals of the present invention are comprised of a hydrazido or 5 diazenido bonding unit and an ancillary ligand, A<sub>L1</sub>, or a bonding unit and two types of ancillary A<sub>L1</sub> and A<sub>L2</sub>, or a tetridentate chelator comprised of two nitrogen and two sulfur atoms. Ancillary ligands A<sub>L1</sub> are comprised of two or more hard donor atoms such as oxygen and amine 10 nitrogen (sp<sup>3</sup> hybridized). The donor atoms occupy at least two of the sites in the coordination sphere of the radionuclide metal; the ancillary ligand A<sub>L1</sub> serves as one of the three ligands in the ternary ligand system. Examples of ancillary ligands A<sub>L1</sub> include but are not 15 limited to dioxygen ligands and functionalized aminocarboxylates. A large number of such ligands are available from commercial sources.

- Ancillary dioxygen ligands include ligands that coordinate to the metal ion through at least two oxygen 20 donor atoms. Examples include but are not limited to: glucoheptonate, gluconate, 2-hydroxyisobutyrate, lactate, tartrate, mannitol, glucarate, maltol, Kojic acid, 2,2-bis(hydroxymethyl)propionic acid, 4,5-dihydroxy-1,3-benzene disulfonate, or substituted or 25 unsubstituted 1,2 or 3,4 hydroxypyridinones. (The names for the ligands in these examples refer to either the protonated or non-protonated forms of the ligands.)

- Functionalized aminocarboxylates include ligands that have a combination of amine nitrogen and oxygen 30 donor atoms. Examples include but are not limited to: iminodiacetic acid, 2,3-diaminopropionic acid, nitrilotriacetic acid, N,N'-ethylenediamine diacetic acid, N,N,N'-ethylenediamine triacetic acid, hydroxyethylethylenediamine triacetic acid, and 35 N,N'-ethylenediamine bis-hydroxyphenylglycine. (The names for the ligands in these examples refer to either the protonated or non-protonated forms of the ligands.)

A series of functionalized aminocarboxylates are disclosed by Bridger et. al. in U.S. Patent 5,350,837, herein incorporated by reference, that result in improved rates of formation of technetium labeled hydrazino 5 modified proteins. We have determined that certain of these aminocarboxylates result in improved yields of the radiopharmaceuticals of the present invention. The preferred ancillary ligands  $A_{L1}$  functionalized aminocarboxylates that are derivatives of glycine; the 10 most preferred is tricine (tris(hydroxymethyl)methylglycine).

The most preferred technetium radiopharmaceuticals of the present invention are comprised of a hydrazido or diazenido bonding unit and two types of ancillary 15 designated  $A_{L1}$  and  $A_{L2}$ , or a diaminedithiol chelator. The second type of ancillary ligands  $A_{L2}$  are comprised of one or more soft donor atoms selected from the group: phosphine phosphorus, arsine arsenic, imine nitrogen ( $sp^2$  hybridized), sulfur ( $sp^2$  hybridized) and carbon ( $sp$  hybridized); atoms which have p-acid character. Ligands  $A_{L2}$  can be monodentate, bidentate or tridentate, the denticity is defined by the number of donor atoms in the ligand. One of the two donor atoms in a bidentate ligand and one of the three donor atoms in a tridentate ligand 20 must be a soft donor atom. We have disclosed in co-pending U.S.S.N. 08/415,908, and U.S.S.N. 60/013360 and 08/646,886, the disclosures of which are herein incorporated by reference in their entirety, that radiopharmaceuticals comprised of one or more ancillary 25 or co-ligands  $A_{L2}$  are more stable compared to radiopharmaceuticals that are not comprised of one or more ancillary ligands,  $A_{L2}$ ; that is, they have a minimal number of isomeric forms, the relative ratios of which do not change significantly with time, and that remain 30 substantially intact upon dilution.

The ligands  $A_{L2}$  that are comprised of phosphine or arsine donor atoms are trisubstituted phosphines, trisubstituted arsines, tetrasubstituted diphosphines and

- tetr subsituted diarsines. The ligands  $A_{L2}$  that are comprised of imine nitrogen are unsaturated or aromatic nitrogen-containing, 5 or 6-membered heterocycles. The ligands that are comprised of sulfur ( $sp^2$  hybridized) donor atoms are thiocarbonyls, comprised of the moiety C=S. The ligands comprised of carbon ( $sp$  hybridized) donor atoms are isonitriles, comprised of the moiety CNR, where R is an organic radical. A large number of such ligands are available from commercial sources.
- 5 5 donon atoms are thiocarbonyls, comprised of the moiety C=S. The ligands comprised of carbon ( $sp$  hybridized) donor atoms are isonitriles, comprised of the moiety CNR, where R is an organic radical. A large number of such ligands are available from commercial sources.
- 10 Isonitriles can be synthesized as described in European Patent 0107734 and in U.S. Patent 4,988,827, herein incorporated by reference.

Preferred ancillary ligands  $A_{L2}$  are trisubstituted phosphines and unsaturated or aromatic 5 or 6 membered heterocycles. The most preferred ancillary ligands  $A_{L2}$  are trisubstituted phosphines and unsaturated 5 membered heterocycles.

The ancillary ligands  $A_{L2}$  may be substituted with alkyl, aryl, alkoxy, heterocycle, aralkyl, alkaryl and arylalkaryl groups and may or may not bear functional groups comprised of heteroatoms such as oxygen, nitrogen, phosphorus or sulfur. Examples of such functional groups include but are not limited to: hydroxyl, carboxyl, carboxamide, nitro, ether, ketone, amino, ammonium, sulfonate, sulfonamide, phosphonate, and phosphonamide. The functional groups may be chosen to alter the lipophilicity and water solubility of the ligands which may affect the biological properties of the radiopharmaceuticals, such as altering the distribution into non-target tissues, cells or fluids, and the mechanism and rate of elimination from the body.

Chelators or bonding moieties for therapeutic radiopharmaceuticals are selected to form stable complexes with the radioisotopes that have alpha particle, beta particle, Auger or Coster-Kronig electron emissions, such as  $^{186}\text{Re}$ ,  $^{188}\text{Re}$ ,  $^{153}\text{Sm}$ ,  $^{166}\text{Ho}$ ,  $^{177}\text{Lu}$ ,  $^{149}\text{Pm}$ ,  $^{90}\text{Y}$ ,  $^{212}\text{Bi}$ ,  $^{103}\text{Pd}$ ,  $^{109}\text{Pd}$ ,  $^{159}\text{Gd}$ ,  $^{140}\text{La}$ ,  $^{198}\text{Au}$ ,  $^{199}\text{Au}$ ,  $^{169}\text{Yb}$ ,  $^{175}\text{Yb}$ ,  $^{165}\text{Dy}$ ,  $^{166}\text{Dy}$ ,  $^{67}\text{Cu}$ ,  $^{105}\text{Rh}$ ,  $^{111}\text{Ag}$ , and  $^{192}\text{Ir}$ .

- Chelators for rhenium, copper, palladium, platinum, iridium, rhodium, silver and gold isotopes are selected from diaminedithiols, monoamine-monoamidedithiols, triamide-monothiols, monoamine-diamide-monothiols,
- 5 diaminedioximes, and hydrazines. Chelators for yttrium, bismuth, and the lanthanide isotopes are selected from cyclic and acyclic polyaminocarboxylates such as DTPA, DOTA, DO3A, 2-benzyl-DOTA, alpha-(2-phenethyl)1,4,7,10-tetraazacyclododecane-1-acetic-4,7,10-
- 10 tris(methylacetic)acid, 2-benzyl-cyclohexyldiethylenetriaminepentaacetic acid, 2-benzyl-6-methyl-DTPA, and 6,6"-bis[N,N,N",N"-tetra(carboxymethyl)aminomethyl]-4'-(3-amino-4-methoxyphenyl)-2,2':6',2"-terpyridine.
- 15 Chelators for magnetic resonance imaging contrast agents are selected to form stable complexes with paramagnetic metal ions, such as Gd(III), Dy(III), Fe(III), and Mn(II), are selected from cyclic and acyclic polyaminocarboxylates such as DTPA, DOTA, DO3A,
- 20 2-benzyl-DOTA, alpha-(2-phenethyl)1,4,7,10-tetraazacyclododecane-1-acetic-4,7,10-tris(methylacetic)acid, 2-benzyl-cyclohexyldiethylenetriaminepentaacetic acid, 2-benzyl-6-methyl-DTPA, and 6,6"-bis[N,N,N",N"-
- 25 tetra(carboxymethyl)aminomethyl]-4'-(3-amino-4-methoxyphenyl)-2,2':6',2"-terpyridine.

The technetium and rhenium radiopharmaceuticals of the present invention comprised of a hydrazido or diazenido bonding unit can be easily prepared by admixing

30 a salt of a radionuclide, a reagent of the present invention, an ancillary ligand A<sub>L1</sub>, an ancillary ligand A<sub>L2</sub>, and a reducing agent, in an aqueous solution at temperatures from 0 to 100 °C. The technetium and rhenium radiopharmaceuticals of the present invention

35 comprised of a tetridentate chelator having two nitrogen and two sulfur atoms can be easily prepared by admixing a salt of a radionuclide, a reagent of the present

invention, and a reducing agent, in an aqueous solution at temperatures from 0 to 100 °C.

When the bonding unit in the reagent of the present invention is present as a hydrazone group, then it must 5 first be converted to a hydrazine, which may or may not be protonated, prior to complexation with the metal radionuclide. The conversion of the hydrazone group to the hydrazine can occur either prior to reaction with the radionuclide, in which case the radionuclide and the 10 ancillary or co-ligand or ligands are combined not with the reagent but with a hydrolyzed form of the reagent bearing the chelator or bonding unit, or in the presence of the radionuclide in which case the reagent itself is combined with the radionuclide and the ancillary or 15 co-ligand or ligands. In the latter case, the pH of the reaction mixture must be neutral or acidic.

Alternatively, the radiopharmaceuticals of the present invention comprised of a hydrazido or diazenido bonding unit can be prepared by first admixing a salt of 20 a radionuclide, an ancillary ligand  $A_{L1}$ , and a reducing agent in an aqueous solution at temperatures from 0 to 100 °C to form an intermediate radionuclide complex with the ancillary ligand  $A_{L1}$  then adding a reagent of the present invention and an ancillary ligand  $A_{L2}$  and reacting 25 further at temperatures from 0 to 100 °C.

Alternatively, the radiopharmaceuticals of the present invention comprised of a hydrazido or diazenido bonding unit can be prepared by first admixing a salt of 30 a radionuclide, an ancillary ligand  $A_{L1}$ , a reagent of the present invention, and a reducing agent in an aqueous solution at temperatures from 0 to 100 °C to form an intermediate radionuclide complex, and then adding an ancillary ligand  $A_{L2}$  and reacting further at temperatures from 0 to 100 °C.

35 The technetium and rhenium radionuclides are preferably in the chemical form of pertechnetate or perrhenate and a pharmaceutically acceptable cation. The pertechnetate salt form is preferably sodium

pertechnetate such as obtained from commercial Tc-99m generators. The amount of pertechnetate used to prepare the radiopharmaceuticals of the present invention can range from 0.1 mCi to 1 Ci, or more preferably from 1 to 5 200 mCi.

The amount of the reagent of the present invention used to prepare the technetium and rhenium radiopharmaceuticals of the present invention can range from 0.01 µg to 10 mg, or more preferably from 0.5 µg to 10 200 µg. The amount used will be dictated by the amounts of the other reactants and the identity of the radiopharmaceuticals of the present invention to be prepared.

The amounts of the ancillary ligands A<sub>L1</sub> used can 15 range from 0.1 mg to 1 g, or more preferably from 1 mg to 100 mg. The exact amount for a particular radiopharmaceutical is a function of identity of the radiopharmaceuticals of the present invention to be prepared, the procedure used and the amounts and 20 identities of the other reactants. Too large an amount of A<sub>L1</sub> will result in the formation of by-products comprised of technetium labeled A<sub>L1</sub> without a biologically active molecule or by-products comprised of technetium labeled biologically active molecules with the ancillary 25 ligand A<sub>L1</sub> but without the ancillary ligand A<sub>L2</sub>. Too small an amount of A<sub>L1</sub> will result in other by-products such as technetium labeled biologically active molecules with the ancillary ligand A<sub>L2</sub> but without the ancillary ligand A<sub>L1</sub>, or reduced hydrolyzed technetium, or 30 technetium colloid.

The amounts of the ancillary ligands A<sub>L2</sub> used can range from 0.001 mg to 1 g, or more preferably from 0.01 mg to 10 mg. The exact amount for a particular radiopharmaceutical is a function of the identity of the 35 radiopharmaceuticals of the present invention to be prepared, the procedure used and the amounts and identities of the other reactants. Too large an amount of A<sub>L2</sub> will result in the formation of by-products

comprised of technetium labeled  $A_{L2}$  without a biologically active molecule or by-products comprised of technetium labeled biologically active molecules with the ancillary ligand  $A_{L2}$  but without the ancillary ligand  $A_{L1}$ . If the  
5 reagent bears one or more substituents that are comprised of a soft donor atom, as defined above, at least a ten-fold molar excess of the ancillary ligand  $A_{L2}$  to the reagent of formula 2 is required to prevent the substituent from interfering with the coordination of the  
10 ancillary ligand  $A_{L2}$  to the metal radionuclide.

Suitable reducing agents for the synthesis of the radiopharmaceuticals of the present invention include stannous salts, dithionite or bisulfite salts, borohydride salts, and formamidinesulfinic acid, wherein  
15 the salts are of any pharmaceutically acceptable form. The preferred reducing agent is a stannous salt. The amount of a reducing agent used can range from 0.001 mg to 10 mg, or more preferably from 0.005 mg to 1 mg.

The specific structure of a radiopharmaceutical of  
20 the present invention comprised of a hydrazido or diazenido bonding unit will depend on the identity of the reagent of the present invention used, the identity of any ancillary ligand  $A_{L1}$ , the identity of any ancillary ligand  $A_{L2}$ , and the identity of the radionuclide.  
25 Radiopharmaceuticals comprised of a hydrazido or diazenido bonding unit synthesized using concentrations of reagents of <100  $\mu$ g/mL, will be comprised of one hydrazido or diazenido group. Those synthesized using >1 mg/mL concentrations will be comprised of two hydrazido  
30 or diazenido groups from two reagent molecules. For most applications, only a limited amount of the biologically active molecule can be injected and not result in undesired side-effects, such as chemical toxicity, interference with a biological process or an altered  
35 biodistribution of the radiopharmaceutical. Therefore, the radiopharmaceuticals which require higher concentrations of the reagents comprised in part of the

biologically active molecule, will have to be diluted or purified after synthesis to avoid such side-effects.

The identities and amounts used of the ancillary ligands  $A_{L1}$  and  $A_{L2}$  will determine the values of the variables  $y$  and  $z$ . The values of  $y$  and  $z$  can independently be an integer from 1 to 2. In combination, the values of  $y$  and  $z$  will result in a technetium coordination sphere that is made up of at least five and no more than seven donor atoms. For monodentate ancillary ligands  $A_{L2}$ ,  $z$  can be an integer from 1 to 2; for bidentate or tridentate ancillary ligands  $A_{L2}$ ,  $z$  is 1. The preferred combination for monodentate ligands is  $y$  equal to 1 or 2 and  $z$  equal to 1. The preferred combination for bidentate or tridentate ligands is  $y$  equal to 1 and  $z$  equal to 1.

The indium, copper, gallium, silver, palladium, rhodium, gold, platinum, bismuth, yttrium and lanthanide radiopharmaceuticals of the present invention can be easily prepared by admixing a salt of a radionuclide and a reagent of the present invention, in an aqueous solution at temperatures from 0 to 100 °C. These radionuclides are typically obtained as a dilute aqueous solution in a mineral acid, such as hydrochloric, nitric or sulfuric acid. The radionuclides are combined with from one to about one thousand equivalents of the reagents of the present invention dissolved in aqueous solution. A buffer is typically used to maintain the pH of the reaction mixture between 3 and 10.

The gadolinium, dysprosium, iron and manganese metallopharmaceuticals of the present invention can be easily prepared by admixing a salt of the paramagnetic metal ion and a reagent of the present invention, in an aqueous solution at temperatures from 0 to 100 °C. These paramagnetic metal ions are typically obtained as a dilute aqueous solution in a mineral acid, such as hydrochloric, nitric or sulfuric acid. The paramagnetic metal ions are combined with from one to about one thousand equivalents of the reagents of the present

invention dissolved in aqueous solution. A buffer is typically used to maintain the pH of the reaction mixture between 3 and 10.

The total time of preparation will vary depending on  
5 the identity of the metal ion, the identities and amounts  
of the reactants and the procedure used for the  
preparation. The preparations may be complete, resulting  
in > 80% yield of the radiopharmaceutical, in 1 minute or  
may require more time. If higher purity  
10 metallopharmaceuticals are needed or desired, the  
products can be purified by any of a number of techniques  
well known to those skilled in the art such as liquid  
chromatography, solid phase extraction, solvent  
extraction, dialysis or ultrafiltration.

15 Buffers useful in the preparation of  
metallopharmaceuticals and in diagnostic kits useful for  
the preparation of said radiopharmaceuticals include but  
are not limited to phosphate, citrate, sulfosalicylate,  
and acetate. A more complete list can be found in the  
20 United States Pharmacopeia.

Lyophilization aids useful in the preparation of  
diagnostic kits useful for the preparation of  
radiopharmaceuticals include but are not limited to  
mannitol, lactose, sorbitol, dextran, Ficoll, and  
25 polyvinylpyrrolidine(PVP).

Stabilization aids useful in the preparation of  
metallopharmaceuticals and in diagnostic kits useful for  
the preparation of radiopharmaceuticals include but are  
not limited to ascorbic acid, cysteine, monothioglycerol,  
30 sodium bisulfite, sodium metabisulfite, gentisic acid,  
and inositol.

Solubilization aids useful in the preparation of  
metallopharmaceuticals and in diagnostic kits useful for  
the preparation of radiopharmaceuticals include but are  
35 not limited to ethanol, glycerin, polyethylene glycol,  
propylene glycol, polyoxyethylene sorbitan monooleate,  
sorbitan monololeate, polysorbates,  
poly(oxyethylene)poly(oxypropylene)poly(oxyethylene)

block copolymers (Pluronics) and lecithin. Preferred solubilizing aids are polyethylene glycol, and Pluronics.

Bacteriostats useful in the preparation of metallopharmaceuticals and in diagnostic kits useful for 5 the preparation of radiopharmaceuticals include but are not limited to benzyl alcohol, benzalkonium chloride, chlorbutanol, and methyl, propyl or butyl paraben.

A component in a diagnostic kit can also serve more than one function. A reducing agent can also serve as a 10 stabilization aid, a buffer can also serve as a transfer ligand, a lyophilization aid can also serve as a transfer, ancillary or co-ligand and so forth.

The diagnostic radiopharmaceuticals are administered by intravenous injection, usually in saline solution, at 15 a dose of 1 to 100 mCi per 70 kg body weight, or preferably at a dose of 5 to 50 mCi. Imaging is performed using known procedures.

The therapeutic radiopharmaceuticals are administered by intravenous injection, usually in saline 20 solution, at a dose of 0.1 to 100 mCi per 70 kg body weight, or preferably at a dose of 0.5 to 5 mCi per 70 kg body weight.

The magnetic resonance imaging contrast agents of 25 the present invention may be used in a similar manner as other MRI agents as described in U.S. Patent 5,155,215; U.S. Patent 5,087,440; Margerstadt et al., Magn. Reson. Med., 1986, 3, 808; Runge et al., Radiology, 1988, 166, 835; and Bousquet et al., Radiology, 1988, 166, 693. Generally, sterile aqueous solutions of the contrast 30 agents are administered to a patient intravenously in dosages ranging from 0.01 to 1.0 mmoles per kg body weight.

For use as X-ray contrast agents, the compositions of the present invention should generally have a heavy 35 atom concentration of 1 mM to 5 M, preferably 0.1 M to 2 M. Dosages, administered by intravenous injection, will typically range from 0.5 mmol/kg to 1.5 mmol/kg, preferably 0.8 mmol/kg to 1.2 mmol/kg. Imaging is

performed using known techniques, preferably X-ray computed tomography.

The ultrasound contrast agents of the present invention are administered by intravenous injection in an 5 amount of 10 to 30  $\mu\text{L}$  of the echogenic gas per kg body weight or by infusion at a rate of approximately 3  $\mu\text{L}/\text{kg}/\text{min}$ . Imaging is performed using known techniques of sonography.

Other features of the invention will become apparent 10 in the course of the following descriptions of exemplary embodiments which are given for illustration of the invention and are not intended to be limiting thereof.

#### EXAMPLES

- 15 Representative materials and methods that may be used in preparing the compounds of the invention are described further below.
- 1-methyl-4-oxo-7-(((1-(triphenylmethyl)imidazol-2-yl)amino)methyl)hydroquinoline-3-carboxylic acid, ethyl 20 7-bromo-4-oxohydroquinoline-3-carboxylate, 1-(triphenylmethyl)imidazole-2-ylamine, and methyl 3-amino-2-((2,4,6-trimethylphenyl)sulfonyl)amino propanoate hydrochloride were prepared as described in PCT WO 98/23608. Boc-L-cysteic acid, Boc-L-cysteic acid N- 25 hydroxyphenyl ester, and Boc-L-cysteic acid p-nitrophenyl ester were prepared as described in *Liebigs Ann. Chem.* 1979, 776-783. Benzotriazole-1-yloxy-tris-pyrrolidinophosphonium hexafluorophosphate (PyBOP) was purchased from Novabiochem.
- 30 (tert-butoxy)-N-(3-bromopropyl)formamide and 2-(2-aza-2-((5-((2,5-dioxopyrrolidinyl)carbonyl)(2-pyridyl))-amino)vinyl)benzenesulfonic acid were prepared as described in PCT WO 96/40637. All other chemicals and solvents (reagent grade) were used as supplied from the 35 vendors cited without further purification. t-Butyloxycarbonyl (Boc) amino acids and other starting amino acids may be obtained commercially from Bachem Inc., Bachem Biosciences Inc. (Philadelphia, PA), Advanced ChemTech (Louisville, KY), Peninsula

Laboratories (Belmont, CA), or Sigma (St. Louis, MO). 2-(1H-Benzotriazol-1-yl)-1,1,3,3-tetramethyluronium hexafluorophosphate (HBTU) and TBTU were purchased from Advanced ChemTech. N-methylmorpholine (NMM), *m*-cresol,

5 D-2-aminobutyric acid (Abu), trimethylacetylchloride, diisopropylethylamine (DIEA), 1,2,4-triazole, stannous chloride dihydrate, 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride (EDC), triethylsilane ( $\text{Et}_3\text{SiH}$ ) and tris(3-sulfonatophenyl)phosphine trisodium

10 salt (TPPTS) were purchased from Aldrich Chemical Company. Bis(3-sulfonatophenyl)phenylphosphine disodium salt (TPPDS) was prepared by the published procedure (Kuntz, E., U.S. Patent 4,248,802). (3-Sulfonatophenyl)diphenylphosphine monosodium salt

15 (TPPMS) was purchased from TCI America, Inc. Tricine was obtained from Research Organics, Inc. Technetium-99m-pertechnetate ( $^{99\text{m}}\text{TcO}_4^-$ ) was obtained from a DuPont Pharma  $^{99}\text{Mo}/^{99\text{m}}\text{Tc}$  Techneelite® generator. In-111-chloride (Indichlor®) was obtained from Amersham Medi-Physics,

20 Inc. Sm-153-chloride and Lutetium-177-chloride were obtained from the University of Missouri Research Reactor (MURR). Yttrium-90 chloride was obtained from the Pacific Northwest Research Laboratories. Dimethylformamide (DMF), ethyl acetate, chloroform ( $\text{CHCl}_3$ ), methanol (MeOH), pyridine and hydrochloric acid (HCl) were obtained from Baker. Acetonitrile, dichloromethane (DCM), acetic acid (HOAc), trifluoroacetic acid (TFA), ethyl ether, triethylamine, acetone, and magnesium sulfate were commercially obtained. Absolute ethanol was

25 obtained from Quantum Chemical Corporation.

#### Synthesis of Boc-Glu-(OTFP)-OTFP

To a solution of Boc-Glu-OH (28.9 g, 117 mmol) in DMF (500 mL) at room temperature, and under nitrogen, was 5 added a solution of 2,3,5,6-tetrafluorophenol (48.2 g, 290 mmol) in DMF (50 mL). After stirring for 10 min. EDC (55.6 g, 290 mmol) was added and the reaction mixture was stirred for about 96 h. The volatiles were removed in vacuo and the residue was triturated in 0.1 N HCl (750 mL). To this mixture was added ethyl acetate (600 mL), 10 the layers separated. The aqueous layer was extracted with ethyl acetate (3 x ~500 mL), and all the ethyl acetate fractions were combined, washed with water (300 mL) and brine (300 mL), dried ( $\text{MgSO}_4$ ), and concentrated to 15 give a tan solid (62 g). The tan solid was washed with acetonitrile to give the title compound (45.5 g, 73%) in purified form.

30 Part A - N-(3-(2-(2-(3-aminopropoxy)ethoxy)ethoxy)-propyl)(phenylmethoxy)formamide

A solution of 4,7,10-trioxa-1,13-tridecanediamine (158 mL, 0.72 mol), TEA (16.7 mL, 0.12 mol), and MeOH (300 mL) in peroxide-free THF (1,000 mL) was placed in a 35 3 liter 3-neck flask fitted with a mechanical stirrer, a thermometer, and an addition funnel with nitrogen line. The addition funnel was charged with a solution of benzyl chloroformate (17.1 mL, 0.12 mol) in peroxide-free THF

(1,000 mL). The contents of the flask were cooled below 5 °C. The contents of the addition funnel were added to the flask with rapid stirring over 4 h while keeping the temperature below 5 °C. The solution was stirred an 5 additional 30 min and concentrated to give a thick syrup. This syrup was taken up in saturated NaCl (1800 mL) and 10% Na<sub>2</sub>CO<sub>3</sub> (200 mL) and extracted with ether (3 x 1,000 mL). The combined ether extracts were washed with saturated NaCl (500 mL), dried (MgSO<sub>4</sub>), and concentrated 10 to give a pale yellow oil (36.74 g). Flash chromatography on a 7 x 29 cm silica gel column (DCM/MeOH/TEA, 20/15/0.5) gave the title compound as a colorless syrup (19.14 g, 45%). <sup>1</sup>H NMR (CDCl<sub>3</sub>): 7.33- 7.25 (m, 5H), 5.59 (s, 1H), 5.06 (s, 2H), 3.62-3.45 (m, 12H), 3.32-3.25 (m, 2H), 2.74 (t, J = 6.7 Hz, 2H), 1.75 (pentet, J = 6.0 Hz, 2H), 1.67 (pentet, J = 6.4 Hz, 2H), 1.33 (s, 2H); MS: m/e 355.4 [M+H]; High Resolution MS: Calcd for C<sub>18</sub>H<sub>31</sub>N<sub>2</sub>O<sub>5</sub> [M+H]: 355.2233, Found: 355.2222.

Part B - Methyl 3-((tert-Butoxy)carbonylamino)-2-(((4-(4-((3-(2-(2-(3-((phenylmethoxy)carbonylamino)propoxy)ethoxy)-ethoxy)propyl)amino)sulfonyl)phenyl)phenyl)sulfonyl)-25 amino)propanoate

Biphenyl-4,4'-disulfonyl chloride (2.64 g, 7.5 mmol, freshly recrystallized from CHCl<sub>3</sub>) and DCM (200 mL) were placed in a 500 mL 3-neck flask fitted with a 30 thermometer, an addition funnel, and a nitrogen line. The addition funnel was charged with a solution of N-(3-(2-(2-(3-aminopropoxy)ethoxy)ethoxy)propyl)-(phenylmethoxy)formamide (1.77 g, 5.0 mmol) and DIEA (0.87 mL, 5.0 mmol) in DCM (40 mL). The contents of the 35 flask were cooled below 5 °C. The contents of the addition funnel were added to the flask with rapid

stirring over 3 h while keeping the temperature of the flask below 5 °C. The addition funnel was charged with a solution of N-β-Boc-L-α,β,-diaminopropionic acid methyl ester hydrochloride (2.55 g, 10 mmol) and DIEA (3.8 mL, 22 mmol) in DCM (25 mL). This solution was added to the flask with stirring at 5 °C over 15 min, and stirred at ambient temperatures for an additional 20 h. The reaction solution was washed consecutively with 0.1 N HCl (100 mL) and water (2 x 100 mL), dried ( $\text{MgSO}_4$ ), and concentrated to give a viscous oil (5.79 g). Flash chromatography on a 5 x 21 cm silica gel column (85/15 EtOAc/hexanes, followed by 100% EtOAc) gave a colorless amorphous solid. Recrystallization from toluene (85 mL) gave the title compound as a colorless solid (2.52 g, 59%). Part C - Methyl 3-((1-Methyl-4-oxo-7-(((1-triphenylmethyl)imidazol-2-yl)amino)methyl)(3-hydroquinolyl)carbonylamino)-2-(((4-(4-(((3-(2-(2-(3-((phenylmethoxy)carbonylamino)-propoxy)ethoxy)ethoxy)propyl)amino)sulfonyl)phenyl)phenyl)sulfonyl)amino)propanoate

35 The product of Part B, above (748 mg, 0.88 mmol) was dissolved in 25/75 TFA/DCM (15 mL) and allowed to stand

at ambient temperatures under nitrogen for 15 min. The TFA was removed under vacuum and the resulting amber oil was taken up in 50/50 ACN/water (50 mL), and treated portion wise with Bio-Rad AG-3-X4A resin, hydroxide form, 5 to raise the pH from 2 to 6. The resin was removed by filtration and the filtrate was lyophilized to give a sticky pale yellow foam.

In a separate flask, 1-methyl-4-oxo-7-(((1-(triphenylmethyl)imidazol-2-yl)amino)methyl)hydroquinoline-3-carboxylic acid (432 mg, 0.80 mmol), TEA (0.33 mL), and HBTU (364 mg, 0.96 mmol) were dissolved in anhydrous DMF (25 mL). The resulting solution was stirred at ambient temperatures under a nitrogen atmosphere for 10 min and combined with a 15 solution of the yellow foam in anhydrous DMF (15 mL). The DMF was removed under vacuum after 18 h to give a viscous yellow oil. This oil was taken up in EtOAc (175 mL), washed consecutively with water (25 mL), saturated NaHCO<sub>3</sub> (50 mL), and saturated NaCl (25 mL), dried (MgSO<sub>4</sub>), 20 and concentrated to give a viscous yellow oil. Purification by flash chromatography on a 7 x 25 cm silica gel column using a CHCl<sub>3</sub>/EtOAc/MeOH step gradient (47/47/6, 46/46/8, 60/30/10) gave the title compound as a pale yellow solid (510 mg, 50%). The product from Part C, above (295 mg, 0.232 mmol) was dissolved in a mixture of peroxide-free THF (12 mL), water (1.8 mL), and 3 N LiOH (1.2 mL), and stirred at ambient temperatures under a nitrogen atmosphere for 30 min. The THF was removed under vacuum and the resulting mixture was dissolved in CHCl<sub>3</sub> (75 mL) and water (50 mL). The aqueous layer was adjusted to pH 3 with 0.5 N HCl and the layers were thoroughly mixed. The aqueous layer was extracted with additional CHCl<sub>3</sub> (2 x 25 mL). The combined CHCl<sub>3</sub> extracts were washed with saturated NaCl (50 mL), dried (MgSO<sub>4</sub>), and concentrated to give the title compound as a pale yellow solid (291 mg, 100%).

Part A - Ethyl 4-(3,5-Dimethylphenoxy)butanoate

Sodium metal (17.12 g, 0.744 mol) was added to anhydrous EtOH (350 mL) and stirred until dissolved. 3,5-Dimethylphenol was added and the solution was stirred 10 15 min at ambient temperatures. Ethyl 4-bromoacetate (58.7 mL, 0.41 mol) was added and the solution was stirred at ambient temperatures under a nitrogen atmosphere for 28 h. The EtOH was removed under vacuum and the oily solid was partitioned between water (1 L) 15 and EtOAc (500 mL). The aqueous layer was extracted with additional EtOAc (500 mL). The combined EtOAc extracts were washed consecutively with saturated NaHCO<sub>3</sub> (300 mL) and saturated NaCl (300 mL), dried (MgSO<sub>4</sub>), and concentrated to give an amber liquid. This liquid was 20 vacuum fractional distilled through a 15 cm Vigreux column. The main fraction was collected from 91-117 °C/6 mm Hg to give the title compound as a colorless liquid (77.77 g, 89%). <sup>1</sup>H NMR (CDCl<sub>3</sub>): 6.59 (s, 1H), 6.52 (s, 2H), 4.16 (q, J = 7.16 Hz, 2H), 3.98 (t, J = 6.14 Hz, 2H), 2.49 (t, J = 7.34 Hz, 2H), 2.28 (s, 6H), 2.11-2.07 (m, 2H), 1.26 (t, J = 7.16 Hz, 3H); Anal. calcd for C<sub>14</sub>H<sub>20</sub>O<sub>3</sub>: C, 71.16; H, 8.53. Trifluoroacetate Salt

20 Part A - Ethyl 1-(3-((tert-Butoxy)carbonylamino)propyl)-7-bromo-4-oxohydroquinoline-3-carboxylate

A mixture of ethyl 7-bromo-4-oxohydroquinoline-3-carboxylate (6.28 g, 0.0212 mol), (tert-butoxy)-N-(3-bromopropyl)formamide (30.3 g, 0.127 mol), and anhydrous

25 K<sub>2</sub>CO<sub>3</sub> (12.5 g, 0.904 mol) in anhydrous DMF (200 mL) was stirred at 60 °C under a nitrogen atmosphere for 4 h, and then at ambient temperatures for 72 h. The DMF was removed under vacuum and the resulting oily solid was dissolved in EtOAc (500 mL). The EtOAc solution was washed consecutively with water (500 mL), saturated NaHCO<sub>3</sub> (500 mL), and saturated NaCl (500 mL), dried (MgSO<sub>4</sub>), and concentrated to give a red oil. This oil

- was taken up in EtOAc (250 mL) and cooled, causing a solid ppt to form. This ppt was collected by filtration, washed with cold EtOAc, and dried to give the title compound as a colorless solid (6.25 g, 65%). MP: 140-142

- Part B - Ethyl 1-(3-((tert-Butoxy)carbonylamino)propyl)-  
15 4-oxo-7-vinylhydroquinoline-3-carboxylate

The product from Part A, above (2.98 g, 6.60 mmol) was dissolved in toluene (50 mL) at a temperature of 100 °C and treated with tetrakis(triphenylphosphine)palladium(0) (152 mg, 0.132 mmol). After 5 min the mixture was treated with tributyl(vinyl)tin (1.93 mL, 6.60 mmol) and stirred 4.5 h at 100 °C under a nitrogen atmosphere, and 18 h at ambient temperatures. Additional tributyl(vinyl)tin (0.386 mL) and tetrakis(triphenylphosphine)palladium(0) (152 mg) were added and the mixture was heated at 100 °C for an additional 17 h. The toluene was removed under vacuum and the solid residue was triturated with ether to give the title compound as a pale green solid (1.67 g, 63%). MP: 133-135 °C;  $^1\text{H}$  NMR ( $\text{CDCl}_3$ ): 8.52 (d,  $J = 8.4$  Hz, 1H), 8.51 (s, 1H), 7.55 (d,  $J = 8.4$  Hz, 1H), 7.38 (s, 1H), 6.88-6.82 (m, 1H), 5.97 (d,  $J = 17.4$  Hz, 1H), 5.51 (d,  $J = 10.8$  Hz, 1H), 4.75 (bs, 1H), 4.42 (q,  $J = 7.2$  Hz, 2H), 4.27 (t,  $J = 7.8$  Hz, 2H), 3.6-3.25 (m, 2H), 2.16-2.11 (m, 2H), 1.49 (s, 9H), 1.45 (t,  $J = 7.2$  Hz, 3H); MS:

**Part C - Ethyl 1-(3-((tert-Butoxy)carbonylamino)propyl)-7-formyl-4-oxohydroquinoline-3-carboxylate**

A solution of the product of Part B, above (1.50 g, 3.75 mmol) in dioxane (119 mL) and water (39 mL) was  
 10 treated with a solution of osmium tetroxide (19.6 mg, 0.077 mmol) in dioxane (0.600 mL) and stirred at ambient temperatures under a nitrogen atmosphere for 5 min.  
 Sodium periodate (2.40 g, 11.2 mmol) was added and the  
 15 stirred at ambient temperatures for 2 h. The dioxane was removed under vacuum and the residue was taken up in DCM (500 mL). The DCM solution was washed consecutively with water (500 mL) and saturated NaCl (500 mL), dried (MgSO<sub>4</sub>), and concentrated to give the title compound as an orange oily solid (1.52 g, 100%). <sup>1</sup>H NMR (CDCl<sub>3</sub>):

**Part D - Ethyl 1-(3-((tert-Butoxy)carbonylamino)propyl)-4-oxo-7-(((1-(triphenylmethyl)imidazole-2-yl)amino)methyl)hydroquinoline-3-carboxylate**

A solution of the product of Part C, above (544 mg, 1.35 mmol) and 1-(triphenylmethyl)imidazole-2-ylamine (456 mg, 1.35 mmol) in toluene (60 mL) was heated at reflux under a nitrogen atmosphere with removal of water  
 5 for 5 h. The solution was cooled, treated with Na(OAc)<sub>3</sub>BH (1.14 g, 5.38 mmol) and stirred at ambient temperatures for 18 h. The mixture was diluted with EtOAc (400 mL), washed consecutively with water (500 mL) and saturated NaCl (500 mL), dried (MgSO<sub>4</sub>), and  
 10 concentrated to give an orange solid. This solid was dissolved in 50% ACN and purified by preparative HPLC on a Vydac C-18 column (50 x 250 mm) using a 0.60%/min gradient of 18 to 52% ACN containing 0.1% TFA at a flow rate of 49 mL/min. The main product peak eluting at 30.8  
 15 min was collected and lyophilized to give the title compound as a pale yellow solid (407 mg, 60%). MS: m/e 712.4 [M+H]; High Resolution MS: Calcd for C<sub>43</sub>H<sub>46</sub>N<sub>5</sub>O<sub>5</sub> [M+H]: 712.3499, Found: 712.3485.

Part E - 1-((3-((tert-Butoxy)carbonylamino)propyl)-4-oxo-7-((1-(triphenylmethyl)imidazole-2-yl)amino)methyl)hydroquinoline-3-carboxylic Acid

25 A mixture of the product of Part D, above (997 mg, 1.40 mmol), water (7.3 mL), 3 N LiOH (3.5 mL), and THF (50 mL) was stirred at ambient temperatures under a nitrogen atmosphere for 3 h. The THF was removed under vacuum and the resulting mixture was dissolved in CHCl<sub>3</sub> (500 mL) and water (100 mL). The aqueous layer was adjusted to pH 3 with 1.0 N HCl and the layers were thoroughly mixed. The organic layer was washed consecutively with water (500 mL) and saturated NaCl (500 mL), dried (MgSO<sub>4</sub>), and concentrated to give the title

Part F - Methyl 3-((1-(3-((tert-Butoxy)carbonylamino)propyl)-4-oxo-7-(((1-(triphenylmethyl)imidazole-2-yl)amino)methyl)(3-hydroquinolyl)carbonylamino)-2-(((2,4,6-trimethylphenyl)sulfonyl)amino)propanoate

A solution of the product of Part E, above (300 mg, 0.437 mmol), TEA (0.243 mL, 1.75 mmol), and HBTU (230 mg, 0.606 mmol) in anhydrous DMF (4 mL) was stirred at ambient temperatures for 5 min. A solution of methyl 3-amino-2-(((2,4,6-trimethylphenyl)sulfonyl)amino)propanoate hydrochloride (184 mg, 0.637 mmol) in anhydrous DMF (3 mL) was added and the solution was stirred at ambient temperatures under a nitrogen atmosphere for 2 h. The solution was diluted with EtOAc (200 mL) and washed consecutively with water (2 x 50 mL), saturated  $\text{NaHCO}_3$  (50 mL), and saturated NaCl (50 mL), dried ( $\text{MgSO}_4$ ), and concentrated to give a viscous amber oil. Purification by flash chromatography on a 2.5 x 24 cm silica gel column using a EtOAc/MeOH step gradient (98/2, 95/5, 75/25) gave the title compound as a pale yellow oil (330 mg, 78%). Part G - 3-((1-(3-((tert-Butoxy)carbonylamino)propyl)-4-  
 5 oxo-7-(((1-(triphenylmethyl)imidazole-2-  
 yl)amino)methyl)(3-hydroquinolyl))carbonylamino)-2-  
 ((2,4,6-trimethylphenyl)sulfonyl)amino)propanoic Acid  
 A solution of the product of Part F, above (51 mg,  
 0.052 mmol), water (0.27 mL), and 3 N LiOH (0.13 mL) in  
 10 MeOH (2 mL) was allowed to stand at ambient temperatures  
 for 3.5 h and concentrated under vacuum. The resulting  
 solid was dissolved in water (10 mL) and adjusted to pH 3  
 with 1.0 N HCl. The aqueous mixture was extracted with  
 DCM (2 x 30 mL). The combined DCM extracts were washed  
 15 with saturated NaCl (30 mL), dried ( $\text{MgSO}_4$ ), and  
 concentrated to give the title compound as a colorless  
 solid (72 mg). MS: m/e 952.5 [M+H]; High Resolution MS:

The product of Example 4, Part F (46.1 mg, 0.477 mmol) was dissolved in 50% TFA/DCM (2.0 mL) for 15 min at ambient temperatures and concentrated to give a yellow oil. This oil was dissolved in anhydrous DMF (1.0 mL) and made basic to pH paper with TEA. In a separate flask, the product of Part A, above (26.1 mg, 0.062 mmol), TEA (0.014 mL, 0.099 mmol), and HBTU (27.7 mg, 0.074 mmol) were dissolved in anhydrous DMF (1.0 mL). The resulting solution was allowed to react for 5 min and combined with the DMF solution from the TFA deprotection reaction. The combined solutions were allowed to stand at ambient temperatures under a nitrogen atmosphere for 20 min and concentrated under vacuum. The resulting oil was dissolved in 50% ACN and purified by preparative HPLC on a Vydac C-18 column (22 x 250 mm) using a 1.8%/min gradient of 18 to 72% ACN containing 0.1% TFA at a flow rate of 20 mL/min. A solution of the product of Example 6, Part B (50.5 mg, 0.0398 mmol) in 50/50 TFA/DCM (2 mL) was allowed to react for 20 min at ambient temperatures and concentrated to a viscous oil. This oil was taken up in anhydrous DMF and made basic to pH paper with TEA. This solution was treated with Boc-L-Glu-OH (4.5 mg, 0.0181 mmol) and HBTU (16.6 mg, 0.0438 mmol), and allowed to stand at ambient temperatures for 2 h. The DMF was removed under vacuum and the resulting oil was dissolved in 60% ACN and purified by preparative HPLC on a Vydac C-18 column (22 x 250 mm) using a 1.8%/min gradient of 18 to 72% ACN containing 0.1% TFA at a flow rate of 20 mL/min. The main product peak eluting at 21.5 min was collected and lyophilized to give the title compound as a colorless

powder (38.8 mg, 84%). MS: m/e 2306.5 [M+H-Tr], 2064.4 [M+H-2Tr], 1275.0 [M+2H]; High Resolution MS: Calcd for C<sub>117</sub>H<sub>154</sub>N<sub>19</sub>OS<sub>2</sub> [M+H-Tr]: 2305.0753, Found: 2305.0770.

Tris(trifluoroacetate) Salt

A solution of the product from Part A, above (38.8 mg, 0.0152 mmol), 3 N LiOH (0.075 mL), and water (0.156 mL) in MeOH (2.0 mL) was stirred at ambient temperatures for 18 h. The MeOH was removed under vacuum and the aqueous mixture was diluted with water (50 mL) and adjusted to pH 3 using 0.5 N HCl. The mixture was extracted with DCM (2 x 50 mL). The combined DCM extracts were washed with saturated NaCl (50 mL), dried (MgSO<sub>4</sub>), and concentrated to give a colorless solid. This solid was dissolved in TFA (3.0 mL) along with Et<sub>3</sub>SiH (0.031 mL, 0.178 mol), heated at 70 °C under a nitrogen atmosphere for 11 h, and concentrated to give a yellow oil. This oil was dissolved in water (25 mL) and washed with ether (2 x 25 mL). The aqueous solution was lyophilized to give a pale yellow solid. This solid was dissolved in water and purified by preparative HPLC on a Vydac C-18 column (22 x 250 mm) using 0.1% TFA in water for 5 min followed by a 2.52%/min gradient of 0 to 63% ACN containing 0.1% TFA at a flow rate of 20 mL/min. The

main product peak eluting at 22.4 min was collected and lyophilized to give the title compound as a colorless powder (5.1 mg, 18%). MS: m/e 968.2 [M+2H], 646.0 [M+3H].

## Part A - Carbobenzyloxy-L-Asp(O-t-Bu)-L-Asp(O-t-Bu)-OMe

A solution of Cbz-Asp(O-t-Bu)-OH (1.54 g, 4.76 mmol), H-Asp(O-t-Bu)-OMe·HCl (1.14 g, 4.76 mmol), DIEA (1.85 mL, 10.5 mmol), and HBTU (1.99 g, 5.24 mmol) in DMF (20 mL) was stirred at ambient temperatures for 18 h. Water (100 mL) and EtOAc (50 mL) were added and the layers were separated. The water layer was extracted with EtOAc (2 x 50 mL). The combined EtOAc extracts were washed consecutively with water (50 mL), 10% KHSO<sub>4</sub> (2 x 50 mL), and 10% NaHCO<sub>3</sub> (50 mL). The organic phase was dried (MgSO<sub>4</sub>), and concentrated to give an oily solid. This material was triturated with ether to give the title compound as a colorless solid (2.14g, 89%). MS: m/e 25 1017.6 [2M+H], 509.4 [M+H].

## Part B - Carbobenzyloxy-L-Asp(O-t-Bu)-L-Asp(O-t-Bu)-OH

A mixture of the product of Part A, above (200 mg, 0.393 mmol), LiOH (38 mg, 0.865 mmol), water (40 mL), and THF (200 mL) was stirred at ambient temperatures for 28 h, and concentrated to remove THF. The aqueous mixture 5 was diluted with additional water (20 mL) and washed with EtOAc (20 mL). The aqueous phase was adjusted to pH 4 with 1.0 N HCl and extracted with EtOAc (20 mL). The EtOAc extract was washed with saturated NaCl (15 mL), dried ( $MgSO_4$ ), and concentrated to give a colorless 10 solid. This solid was dissolved in 60% ACN and purified by preparative HPLC on a Vydac C-18 column (22 x 250 mm) using a 2.4%/min gradient of 18 to 90% ACN containing 0.1% TFA at a flow rate of 20 mL/min. The main product peak eluting at 19.0 min was collected and lyophilized to 15 give the title compound as a colorless powder (95 mg, 49%).

25 The product of Example 6, Part B (44.0 mg, 0.0894 mmol) in TFA (1.5 mL) was allowed to stand at ambient temperatures for 45 min and concentrated to a yellow oil. This oil was dissolved in anhydrous DMF (2.0 mL) and made basic to pH paper with TEA. In a separate flask, the 30 product of Part B, above (69.3 mg, 0.0547 mmol) was dissolved in anhydrous DMF (2.0 mL) and pre-activated by treatment with TEA (0.015 mL, 0.104 mmol) and HBTU (32.6 mg, 0.0859 mmol). After 10 min this solution was added to the DMF solution from the TFA deprotection reaction, 35 and the combined solutions were stirred at ambient temperatures for 30 min. The DMF was removed under vacuum and the resulting oil was dissolved in 60% ACN and purified by preparative HPLC on a Vydac C-18 column (22 x 250 mm) using a 1.54%/min gradient of 18 to 72% ACN.

containing 0.1% TFA at a flow rate of 20 mL/min. The main product peak eluting at 29.9 min was adjusted to pH 8 with saturated NaHCO<sub>3</sub> and concentrated to remove the ACN. The remaining aqueous mixture was extracted with 5 EtOAc (2 x 40 mL). The combined EtOAc extracts were washed with saturated NaCl (40 mL), dried (MgSO<sub>4</sub>), and concentrated to give the title compound as a colorless solid (56.4 mg, 63%). Part A - Preparation of Boc-Glu(aminoethyl-3,6-O-disulfo-  
10 β-D-galactopyranosyl)-OSu

A solution of Boc-Glu-OMe, aminoethyl-3,6-O-disulfo-  
β-D-galactopyranoside (as described in *Tet. Lett.* 1997,  
53, 11937-11952), DIEA, and HBTU in anhydrous DMF is  
stirred at ambient temperatures under nitrogen for 18 h.  
15 The DMF is removed under vacuum and the resulting residue  
is hydrolyzed using aqueous NaOH. The reaction solution  
is adjusted to pH 7 and purified by preparative anion  
exchange chromatography using a resin such as DEAE  
Cellulose and a Et<sub>3</sub>NH<sub>2</sub>CO<sub>3</sub> gradient. The product fraction  
20 is treated with a cation exchange resin, sodium form, to  
give the intermediate carboxylic acid as the sodium salt.

The above compound, N-hydroxysuccinimide, and DCC  
are dissolved in anhydrous DMF and stirred at ambient  
temperatures under nitrogen for 18 h. The DMF is removed  
25 under vacuum and the resulting residue is purified by  
preparative anion exchange chromatography as above to  
give the title compound as the triethylammonium salt.

15 Part A - Preparation of Boc-Glu(6-amino-6-deoxy- $\beta$ -cyclodextryl)-OMe  
A solution of Boc-Glu-OMe, 6-amino-6-deoxy- $\beta$ -cyclodextrin (as described in *J. Org. Chem.* 1996, 61, 903-908), DIEA, and HBTU in anhydrous DMF is stirred at ambient temperatures under nitrogen for 18 h. The DMF is removed under vacuum and the resulting residue is purified by preparative HPLC on a C18 column using a water:ACN:0.1% TFA gradient. The product fraction is lyophilized to give the title compound.

25

Part B - Preparation of Boc-Glu(6-amino-6-deoxy- $\beta$ -cyclodextryl)-OSu

The product of Part A, above, is hydrolyzed by stirring in a mixture of LiOH, THF, and water at ambient temperatures under nitrogen for 4 h. The THF is removed

under vacuum and the resulting mixture is diluted with water and adjusted to pH 3 using 0.1 N HCl. The mixture is extracted with EtOAc, and the combined extracts are dried ( $MgSO_4$ ) and concentrated. The resulting material  
5 is dissolved in anhydrous DMF along with N-hydroxysuccinimide, and DCC, and stirred at ambient temperatures under nitrogen for 18 h. The DMF is removed under vacuum and the resulting residue is purified by preparative HPLC on a C18 column using a water:ACN:0.1%  
10 TFA gradient. The product fraction is lyophilized to give the title compound.

Part B - Preparation of Boc-Glu(amino- $\omega$ -methoxypolyethylene glycol)-OSu

The product of Part A, above, is hydrolyzed by stirring in a mixture of LiOH, THF, and water at ambient 20 temperatures under nitrogen for 4 h. The THF is removed under vacuum and the resulting solution is adjusted to pH 7 using 0.1 N HCl. The solution is desalted using a Sephadex PD-10 desalting column and the product eluant is lyophilized. The resulting material is dissolved in 25 anhydrous DMF along with N-hydroxysuccinimide, and DCC, and stirred at ambient temperatures under nitrogen for 18 h. The DMF is removed under vacuum and the resulting residue is purified by preparative HPLC on a C18 column using a water:ACN:0.1% TFA gradient. The product 30 fraction is lyophilized to give the title compound.

Part C - DOTA/2-(((4-(3-(3-(2-(3-(2-Amino-4-(N-( $\omega$ -methoxypolyethylene(5,000)glycoxyethyl)carbamoyl)-butanoylamino)propoxy)ethoxy)ethoxy)propyl)carbamoyl)-propoxy)-2,6-dimethylphenyl)sulfonyl)amino)-3-((7-((imidazol-2-ylamino)methyl)-1-methyl-4-oxo(3-hydroquinolyl)carbonylamino)propanoic Acid  
Bis(trifluoroacetate) Salt Conjugate

The title compound is prepared by the same procedure described for Example 10 by substituting Boc-Glu(amino- $\omega$ -methoxypolyethylene glycol)-OSu for Boc-Cys(O<sub>3</sub>H)-OSu.

A solution of bis(phosphonomethyl)glycine, DIEA, and HBTU in anhydrous DMF is stirred at ambient temperatures under nitrogen for 15 min, and treated with the product of Example 16. Stirring is continued for 18 h and the DMF is removed under vacuum. The resulting residue is purified by ion exchange chromatography.

Example 18

2-(((4-(3-(N-(3-(2-(2-(3-(2-(2-((2-((2-(bis(carboxymethyl)-amino)ethyl)(carboxymethyl)amino)ethyl)(carboxymethyl)amino)acetyl)amino)-3-sulfopropyl)propoxy)ethoxy)-ethoxy)propyl)carbamoyl)propoxy)-2,6-dimethylphenyl)sulfonyl)amino)-3-((7-((imidazol-2-ylamino)methyl)-1-methyl-4-oxo(3-hydroquinolyl))carbonylamino)propanoic Acid

The product of Example 10, Part A is dissolved in degassed TFA and stirred at ambient temperatures for 15 min. The solution is concentrated under vacuum, and the resulting residue is dissolved in 50% ACN and lyophilized to remove the last traces of TFA. The material is dissolved in anhydrous DMF along with DIEA and diethylenetriaminepentaacetic dianhydride. The resulting solution is stirred at ambient temperatures under nitrogen for 18 h. The DMF is removed under vacuum and the resulting residue is purified by preparative HPLC on a C18 column using a water:ACN:0.1% TFA gradient. The product fraction is lyophilized to give the title compound.

The following procedure describe the synthesis of radiopharmaceuticals of the present invention of the formula  $^{99m}\text{Tc}(\text{VnA})(\text{tricine})(\text{phosphine})$ , in which (VnA) represents a vitronectin receptor antagonist compound of the present invention bonded to the Tc through a diazenido ( $-\text{N}=\text{N}-$ ) or hydrazido ( $=\text{N}-\text{NH}-$ ) moiety. The diazenido or hydrazido moiety results from the reaction of the hydrazinonicotinamido group, present either as the free hydrazine or protected as a hydrazone, with the Tc- $^{99m}$ . The other two ligands in the Tc coordination sphere are tricine and a phosphine.

### Synthesis of Complexes [ $^{99m}\text{Tc}$ (HYNIC-VnA)(tricine)(TPPTS)]

To a lyophilized vial containing 4.84 mg TPPTS, 6.3 mg tricine, 40 mg mannitol, succinic acid buffer, pH 4.8.

and 0.1% Pluronic F-64 surfactant, was added 1.1 mL sterile water for injection, 0.2 mL (20 µg) of the appropriate HYNIC-conjugated vitronectin antagonist (VnA) in deionized water or 50% aqueous ethanol, and 0.2 mL of 5  $^{99m}\text{TcO}_4^-$  (50±5 mCi) in saline. The reconstituted kit was heated in a 100°C water bath for 15 minutes, and was allowed to cool 10 minutes at room temperature. A sample of the reaction mixture was analyzed by HPLC. The RCP results are 10 listed in the Table 1.

Acid

The gadolinium complex of the conjugate of Example 18 is prepared according to the following procedure. 3-3.5 mg of the conjugate is dissolved in 2 mL 1 M ammonium acetate buffer at pH 7.0 , and one equivalent Gd(NO<sub>3</sub>)<sub>3</sub> solution (0.02 M in water) is added to it. The reaction mixture is allowed to stay at room temperature for 3-5 hours and the product is isolated by HPLC. The fraction containing the complex is lyophilized and dissolved in 1 mL H<sub>2</sub>O. The identity of the complex is confirmed by mass spectroscopy.

20 The product of Step I, above (7.5 mg, 0.0039 mmol) was dissolved in a solution of peroxide-free THF (1.40 mL) and water (0.21 mL), and treated with 3 N LiOH (0.14 mL). The mixture was stirred at ambient temperatures under nitrogen for 1 h, and concentrated to dryness under 25 vacuum. The resulting solid residue was dissolved in 95/5 TFA/Et<sub>3</sub>SiH (2.0 mL) and heated at 70 °C under nitrogen for 1 h. The solution was concentrated under vacuum and the resulting solid residue was purified by HPLC on a Vydac C-18 column (22 x 250 mm) using a 30 0.90%/min gradient of 0 to 27% ACN containing 0.1% TFA at a flow rate of 20 mL/min. The main product peak eluting at 20.5 min was lyophilized to give the title compound as a colorless fluffy solid (4.2 mg, 71.9%). Part A - Preparation of Di-2,3,5,6-tetrafluorophenyl (2S)-2-[(tert-Butoxy)carbonylamino]pentane-1,5-dioate

20

To a solution of Boc-L-Glu-OH (28.9 g, 117 mmol) in DMF (500 mL) at ambient temperatures and under nitrogen, was added a solution of 2,3,5,6-tetrafluorophenol (48.2

g, 290 mmol) in DMF (50 mL). After stirring for 10 min, EDC (55.6 g, 290 mmol) was added and the mixture was stirred for 96 h. The volatiles were removed under vacuum and the residue was triturated with 0.1 N HCl (750 mL). To this mixture was added EtOAc (600 mL) and the layers were separated. The aqueous layer was extracted with EtOAc (3 x 500 mL), and all EtOAc extracts were combined, washed consecutively with water (300 mL) and saturated NaCl (300 mL), dried ( $\text{MgSO}_4$ ), and concentrated to give a tan solid (62 g). The tan solid was washed with ACN to give the title compound (45.5 g, 73.0%) in purified form. MS: m/e 566.0 [M+Na].

Part B - Preparation of (2R)-2-[4-(N-((1R)-1-[N-(2-{4-[4-((1S)-2-((7-[(1-(Triphenylmethyl)imidazol-2-yl]amino)methyl]-1-methyl-4-oxo(3-hydroquinolyl))-carbonylamino)-1-(methoxycarbonyl)ethyl]amino}sulfonyl)-3,5-dimethylphenoxy]butanoylamino)ethyl)carbamoyl]-2-sulfoethyl]carbamoyl) (4S)-4-[(tert-butoxy)carbonylamino]-butanoylamino]-N-(2-{4-((1S)-2-((7-[(imidazol-2-ylamino)methyl]-1-methyl-4-oxo(3-hydroquinolyl))-carbonylamino)-1-(methoxycarbonyl)ethyl]amino}sulfonyl)-3,5-dimethylphenoxy]butanoylamino)ethyl)propanesulfonic Acid

Utility

The pharmaceuticals of the present invention are useful for imaging angiogenic tumor vasculature, therapeutic cardiovascular angiogenesis, and cardiac pathologies associated with the expression of vitronectin receptors in a patient or for treating cancer in a patient. The radiopharmaceuticals of the present invention comprised of a gamma ray or positron emitting isotope are useful for imaging of pathological processes involving angiogenic neovasculature, including cancer, diabetic retinopathy, macular degeneration, restenosis of blood vessels after angioplasty, and wound healing, as well as atherosclerotic plaque, myocardial reperfusion injury, and myocardial ischemia, stunning or infarction.

10 The radiopharmaceuticals of the present invention comprised of a beta, alpha or Auger electron emitting isotope are useful for treatment of pathological processes involving angiogenic neovasculature, by delivering a cytotoxic dose of radiation to the locus of the angiogenic neovasculature. The treatment of cancer is affected by the systemic administration of the radiopharmaceuticals resulting in a cytotoxic radiation dose to tumors.

15

20

The compounds of the present invention comprised of one or more paramagnetic metal ions selected from gadolinium, dysprosium, iron, and manganese, are useful as contrast agents for magnetic resonance imaging (MRI) of pathological processes involving angiogenic neovasculature, as well as atherosclerotic plaque, myocardial reperfusion injury, and myocardial ischemia, stunning or infarction.

25

30

The compounds of the present invention comprised of one or more heavy atoms with atomic number of 20 or greater are useful as X-ray contrast agents for X-ray imaging of pathological processes involving angiogenic neovasculature, as well as atherosclerotic plaque, myocardial reperfusion injury, and myocardial ischemia, stunning or infarction.

35

The compounds of the present invention comprised of an echogenic gas containing surfactant microsphere are useful as ultrasound contrast agents for sonography of pathological processes involving angiogenic 5 neovasculature, as well as atherosclerotic plaque, myocardial reperfusion injury, and myocardial ischemia, stunning or infarction.

Representative compounds of the present invention 10 were tested in the following in vitro assays and in vivo models and were found to be active.

#### **Immobilized Human Placental avb3 Receptor Assay**

The assay conditions were developed and validated 15 using [<sup>125</sup>I]vitronectin. Assay validation included Scatchard format analysis (n=3) where receptor number (B<sub>max</sub>) and K<sub>d</sub> (affinity) were determined. Assay format is such that compounds are preliminarily screened at 10 and 100 nM final concentrations prior to IC<sub>50</sub> determination. 20 Three standards (vitronectin, anti-avB3 antibody, LM609, and anti-avB5, P1F6) and five reference peptides have been evaluated for IC<sub>50</sub> determination. Briefly, the method involves immobilizing previously 25 isolated receptors in 96 well plates and incubating overnight. The receptors were isolated from normal, fresh, non-infectious (HIV, hepatitis B and C, syphilis, and HTLV free) human placenta. The tissue was lysed and tissue debris removed via centrifugation. The lysate was filtered. The receptors were isolated by affinity 30 chromatography using the immobilized avb3 antibody. The plates are then washed 3x with wash buffer. Blocking buffer is added and plates incubated for 120 minutes at room temperature. During this time compounds to be tested and [<sup>125</sup>I]vitronectin are premixed in a reservoir 35 plate. Blocking buffer is removed and compound mixture pipetted. Competition is carried out for 60 minutes at room temperature. Unbound material is then removed and wells are separated and counted via gamma scintillation.

**Oncomouse® Imaging**

The study involves the use of the c-Neu Oncomouse® and FVB mice simultaneously as controls. The mice are anesthetized with sodium pentobarbital and injected with approximately 0.5 mCi of radiopharmaceutical. Prior to injection, the tumor locations on each Oncomouse® are recorded and tumor size measured using calipers. The animals are positioned on the camera head so as to image the anterior or posterior of the animals. 5 Minute dynamic images are acquired serially over 2 hours using a 256x256 matrix and a zoom of 2x. Upon completion of the study, the images are evaluated by circumscribing the tumor as the target region of interest (ROI) and a background site in the neck area below the carotid salivary glands.

This model can also be used to assess the effectiveness of the radiopharmaceuticals of the present invention comprised of a beta, alpha or Auger electron emitting isotope. The radiopharmaceuticals are administered in appropriate amounts and the uptake in the tumors can be quantified either non-invasively by imaging for those isotopes with a coincident imageable gamma emission, or by excision of the tumors and counting the amount of radioactivity present by standard techniques. The therapeutic effect of the radiopharmaceuticals can be assessed by monitoring the rate of growth of the tumors in control mice versus those in the mice administered the radiopharmaceuticals of the present invention.

This model can also be used to assess the compounds of the present invention comprised of paramagnetic metals as MRI contrast agents. After administration of the appropriate amount of the paramagnetic compounds, the whole animal can be placed in a commercially available magnetic resonance imager to image the tumors. The effectiveness of the contrast agents can be readily seen by comparison to the images obtain from animals that are not administered a contrast agent.

This model can also be used to assess the compounds of the present invention comprised of heavy atoms as X-

ray contrast agents. After administration of the appropriate amount of the X-ray absorbing compounds, the whole animal can be placed in a commercially available X-ray imager to image the tumors. The effectiveness of the 5 contrast agents can be readily seen by comparison to the images obtain from animals that are not administered a contrast agent.

This model can also be used to assess the compounds of the present invention comprised of an echogenic gas 10 containing surfactant microsphere as ultrasound contrast agents. After administration of the appropriate amount of the echogenic compounds, the tumors in the animal can be imaging using an ultrasound probe held proximate to the tumors. The effectiveness of the contrast agents can 15 be readily seen by comparison to the images obtain from animals that are not administered a contrast agent.

#### Rabbit Matrigel Model

This model was adapted from a matrigel model 20 intended for the study of angiogenesis in mice. Matrigel (Becton & Dickinson, USA) is a basement membrane rich in laminin, collagen IV, entactin, HSPG and other growth factors. When combined with growth factors such as bFGF [500 ng/ml] or VEGF [2 µg/ml] and injected subcutaneously 25 into the mid-abdominal region of the mice, it solidifies into a gel and stimulates angiogenesis at the site of injection within 4-8 days. In the rabbit model, New Zealand White rabbits (2.5-3.0 kg) are injected with 2.0 ml of matrigel, plus 1 µg bFGF and 4 µg VEGF. The 30 radiopharmaceutical is then injected 7 days later and the images obtained.

This model can also be used to assess the effectiveness of the radiopharmaceuticals of the present invention comprised of a beta, alpha or Auger electron 35 emitting isotope. The radiopharmaceuticals are administered in appropriate amounts and the uptake at the angiogenic sites can be quantified either non-invasively by imaging for those isotopes with a coincident imageable gamma emission, or by excision of the angiogenic sites

and counting the amount of radioactivity present by standard techniques. The therapeutic effect of the radiopharmaceuticals can be assessed by monitoring the rate of growth of the angiogenic sites in control rabbits 5 versus those in the rabbits administered the radiopharmaceuticals of the present invention.

This model can also be used to assess the compounds of the present invention comprised of paramagnetic metals as MRI contrast agents. After administration of the 10 appropriate amount of the paramagnetic compounds, the whole animal can be placed in a commercially available magnetic resonance imager to image the angiogenic sites. The effectiveness of the contrast agents can be readily seen by comparison to the images obtain from animals that 15 are not administered a contrast agent.

This model can also be used to assess the compounds of the present invention comprised of heavy atoms as X-ray contrast agents. After administration of the appropriate amount of the X-ray absorbing compounds, the 20 whole animal can be placed in a commercially available X-ray imager to image the angiogenic sites. The effectiveness of the contrast agents can be readily seen by comparison to the images obtain from animals that are not administered a contrast agent.

25 This model can also be used to assess the compounds of the present invention comprised of an echogenic gas containing surfactant microsphere as ultrasound contrast agents. After administration of the appropriate amount of the echogenic compounds, the angiogenic sites in the 30 animal can be imaging using an ultrasound probe held proximate to the tumors. The effectiveness of the contrast agents can be readily seen by comparison to the images obtain from animals that are not administered a contrast agent.

#### Canine Spontaneous Tumor Model

Adult dogs with spontaneous mammary tumors were sedated with xylazine (20 mg/kg)/atropine (1 ml/kg). Upon sedation the animals were intubated using ketamine

(5 mg/kg)/diazepam (0.25 mg/kg) for full anesthesia. Chemical restraint was continued with ketamine (3 mg/kg)/xylazine (6 mg/kg) titrating as necessary. If required the animals were ventilated with room air via an endotrachael tube (12 strokes/min, 25 ml/kg) during the study. Peripheral veins were catheterized using 20G I.V. catheters, one to serve as an infusion port for compound while the other for exfusion of blood samples. Heart rate and EKG were monitored using a cardiotachometer (Biotech, Grass Quincy, MA) triggered from a lead II electrocardiogram generated by limb leads. Blood samples are generally taken at ~10 minutes (control), end of infusion, (1 minute), 15 min, 30 min, 60 min, 90 min, and 120 min for whole blood cell number and counting.

Radiopharmaceutical dose was 300  $\mu$ Ci/kg administered as an i.v. bolus with saline flush. Parameters were monitored continuously on a polygraph recorder (Model 7E Grass) at a paper speed of 10 mm/min or 10 mm/sec.

Imaging of the laterals were for 2 hours with a 256x256 matrix, no zoom, 5 minute dynamic images. A known source is placed in the image field (20-90  $\mu$ Ci) to evaluate region of interest (ROI) uptake. Images were also acquired 24 hours post injection to determine retention of the compound in the tumor. The uptake is determined by taking the fraction of the total counts in an inscribed area for ROI/source and multiplying the known  $\mu$ Ci. The result is  $\mu$ Ci for the ROI.

This model can also be used to assess the effectiveness of the radiopharmaceuticals of the present invention comprised of a beta, alpha or Auger electron emitting isotope. The radiopharmaceuticals are administered in appropriate amounts and the uptake in the tumors can be quantified either non-invasively by imaging for those isotopes with a coincident imageable gamma emission, or by excision of the tumors and counting the amount of radioactivity present by standard techniques. The therapeutic effect of the radiopharmaceuticals can be assessed by monitoring the size of the tumors over time.

This model can also be used to assess the compounds

of the present invention comprised of paramagnetic metals as MRI contrast agents. After administration of the appropriate amount of the paramagnetic compounds, the whole animal can be placed in a commercially available 5 magnetic resonance imager to image the tumors. The effectiveness of the contrast agents can be readily seen by comparison to the images obtain from animals that are not administered a contrast agent.

This model can also be used to assess the compounds 10 of the present invention comprised of heavy atoms as X-ray contrast agents. After administration of the appropriate amount of the X-ray absorbing compounds, the whole animal can be placed in a commercially available X-ray imager to image the tumors. The effectiveness of the 15 contrast agents can be readily seen by comparison to the images obtain from animals that are not administered a contrast agent.

This model can also be used to assess the compounds 20 of the present invention comprised of an echogenic gas containing surfactant microsphere as ultrasound contrast agents. After administration of the appropriate amount of the echogenic compounds, the tumors in the animal can be imaging using an ultrasound probe held proximate to the tumors. The effectiveness of the contrast agents can 25 be readily seen by comparison to the images obtain from animals that are not administered a contrast agent.

Cardiovascular disease models that can be used to 30 assess the diagnostic radiopharmaceuticals, magnetic resonance, X-ray and ultrasound contrast agents of the present invention are reviewed in J. Nucl. Cardiol., 1998, 5, 167-83. There are several well established rabbit models of atherosclerosis; one model produces predominantly proliferating smooth muscle cells by balloon deendothelialization of infradiaphragmatic 35 abdominal aorta to simulate restenotic lesions; another model that produces simulated advanced human atherosclerotic plaque by balloon deendothelialization followed by a high cholesterol diet.

A model of congestive heart failure is described in Am. J. Physiol., 1998, 274, H1516-23. In general, Yorkshire pigs are randomly assigned to undergo 3 wks of rapid atrial pacing at 240 beats/min. or to be sham controls.

- 5 The pigs are chronically instrumented to measure left ventricular function in the conscious state. The pigs are anesthetized.

A shielded stimulating electrode is sutured onto the left atrium, connected to a modified programmable pace maker

- 10 and buried in a subcutaneous pocket. The pericardium is closed loosely, the thoracotomy is closed, and the pleural space is evacuated of air. After a recovery period of 7-10 days, the pacemaker is activated in the animals selected to undergo chronic rapid pacing. The  
15 animals are sedated, the pacemaker is deactivated (pacing groups only). After a 30 min stabilization period, indexes of LV function and geometry are determined (by echocardiography as a control) by injecting the radiolabeled compound. For biodistribution, the animals  
20 are anesthetized, the heart extirpate and the LV apex and midventricular regions are evaluated.

A rat model of reversible coronary occlusion and reperfusion is described in McNulty et al., J. Am. Physiol., 1996, H2283-9.

- 25 Obviously, numerous modifications and variations of the present invention are possible in light of the above teachings. It is therefore to be understood that within the scope of the appended claims, the invention may be practiced otherwise than as specifically described.  
30 herein.

## WHAT IS CLAIMED IS DESCRIBED BELOW:

1. A compound, comprising: a targeting moiety and a chelator, wherein the targeting moiety is bound to the chelator, is a quinolone nonpeptide, and binds to a receptor that is upregulated during angiogenesis and the compound has 0-1 linking groups between the targeting moiety and chelator.

10 2. A compound according to Claim 1, wherein the receptor is the integrin  $\alpha_v\beta_3$  or  $\alpha_v\beta_5$  and the compound is of the formula:

H, C<sub>1</sub>-C<sub>6</sub> alkyl, C<sub>3</sub>-C<sub>7</sub> cycloalkyl, C<sub>3</sub>-C<sub>7</sub> cycloalkyl(C<sub>1</sub>-C<sub>4</sub> alkyl)-, (C<sub>1</sub>-C<sub>10</sub> alkyl)carbonyl, aryl, heteroaryl, aryl(C<sub>1</sub>-C<sub>6</sub> alkyl)-, and heteroaryl(C<sub>1</sub>-C<sub>6</sub> alkyl)-, wherein said aryl or heteroaryl groups are substituted with 0-2 substituents independently selected from the group consisting of C<sub>1</sub>-C<sub>4</sub> alkyl, C<sub>1</sub>-C<sub>4</sub> alkoxy, F, Cl, Br, CF<sub>3</sub>, and NO<sub>2</sub>,

30 alternatively, when R<sup>10e</sup> and R<sup>11e</sup> are both substituents on the same nitrogen atom (as in -NR<sup>10e</sup>R<sup>11e</sup>) they may be taken together with the nitrogen atom to which they are attached to form a heterocycle selected from: 3-azabicyclononyl, 1,2,3,4-tetrahydro-1-quinolinyl,

1,2,3,4-tetrahydro-2-isoquinolinyl, 1-piperidinyl,  
1-morpholinyl, 1-pyrrolidinyl, thiamorpholinyl,  
thiazolidinyl, and 1-piperazinyl;  
said heterocycle being substituted with 0-3 groups  
selected from: C<sub>1</sub>-C<sub>6</sub> alkyl, aryl, heteroaryl,  
aryl(C<sub>1</sub>-C<sub>4</sub> alkyl)-, (C<sub>1</sub>-C<sub>6</sub> alkyl)carbonyl, (C<sub>3</sub>-C<sub>7</sub>  
cycloalkyl)carbonyl, (C<sub>1</sub>-C<sub>6</sub> alkoxy)carbonyl, aryl(C<sub>1</sub>-  
C<sub>4</sub> alkoxy)carbonyl, C<sub>1</sub>-C<sub>6</sub> alkylsulfonyl, and  
arylsulfonyl;

10

R<sup>12e</sup> is selected from:

H, C<sub>1</sub>-C<sub>6</sub> alkyl, triphenylmethyl, methoxymethyl,  
methoxyphenyldiphenylmethyl,  
trimethylsilylethoxymethyl, (C<sub>1</sub>-C<sub>6</sub> alkyl)carbonyl,  
(C<sub>1</sub>-C<sub>6</sub> alkoxy)carbonyl, (C<sub>1</sub>-C<sub>6</sub> alkyl)aminocarbonyl,  
C<sub>3</sub>-C<sub>6</sub> alkenyl, C<sub>3</sub>-C<sub>7</sub> cycloalkyl, C<sub>3</sub>-C<sub>7</sub> cycloalkyl(C<sub>1</sub>-  
C<sub>4</sub> alkyl)-, aryl, heteroaryl(C<sub>1</sub>-C<sub>6</sub> alkyl)carbonyl,  
heteroarylcarbonyl, aryl(C<sub>1</sub>-C<sub>6</sub> alkyl)-,  
(C<sub>1</sub>-C<sub>6</sub> alkyl)carbonyl, arylcarbonyl, C<sub>1</sub>-C<sub>6</sub>  
alkylsulfonyl, arylsulfonyl, aryl(C<sub>1</sub>-C<sub>6</sub>  
alkyl)sulfonyl, heteroarylsulfonyl, heteroaryl(C<sub>1</sub>-C<sub>6</sub>  
alkyl)sulfonyl, aryloxycarbonyl, and aryl(C<sub>1</sub>-C<sub>6</sub>  
alcoxy)carbonyl, wherein said aryl groups are  
substituted with 0-2 substituents selected from the  
group consisting of C<sub>1</sub>-C<sub>4</sub> alkyl, C<sub>1</sub>-C<sub>4</sub> alkoxy, halo,  
CF<sub>3</sub>, and nitro;

10  $A^1, A^2, A^3, A^4, A^5, A^6, A^7$ , and  $A^8$  are independently selected at each occurrence from the group:  $NR^{13}, NR^{13}R^{14}, S, SH, S(Pg), O, OH, PR^{13}, PR^{13}R^{14}, P(O)R^{15}R^{16}$ , and a bond to  $L_n$ ;

15  $E$  is a bond,  $CH$ , or a spacer group independently selected at each occurrence from the group:  $C_1-C_{10}$  alkyl substituted with 0-3  $R^{17}$ , aryl substituted with 0-3  $R^{17}$ ,  $C_{3-10}$  cycloalkyl substituted with 0-3  $R^{17}$ , heterocyclo- $C_{1-10}$  alkyl substituted with 0-3  $R^{17}$ , wherein the heterocyclo group is a 5-10 membered heterocyclic ring system containing 1-4 heteroatoms independently selected from N, S, and O,  $C_{6-10}$  aryl- $C_{1-10}$  alkyl substituted with 0-3  $R^{17}$ ,  $C_{1-10}$  alkyl- $C_{6-10}$  aryl- substituted with 0-3  $R^{17}$ , and a 5-10 membered heterocyclic ring system containing 1-4 heteroatoms independently selected from N, S, and O and substituted with 0-3  $R^{17}$ ;

20

25  $R^{13}$  and  $R^{14}$  are each independently selected from the group: a bond to  $L_n$ , hydrogen,  $C_1-C_{10}$  alkyl substituted with 0-3  $R^{17}$ , aryl substituted with 0-3

5           R<sup>17</sup>, C<sub>1-10</sub> cycloalkyl substituted with 0-3 R<sup>17</sup>,  
heterocyclo-C<sub>1-10</sub> alkyl substituted with 0-3 R<sup>17</sup>,  
wherein the heterocyclo group is a 5-10 membered  
heterocyclic ring system containing 1-4 heteroatoms  
independently selected from N, S, and O, C<sub>6-10</sub>  
aryl-C<sub>1-10</sub> alkyl substituted with 0-3 R<sup>17</sup>, C<sub>1-10</sub>  
alkyl-C<sub>6-10</sub> aryl- substituted with 0-3 R<sup>17</sup>, a 5-10  
membered heterocyclic ring system containing 1-4  
heteroatoms independently selected from N, S, and O  
10          and substituted with 0-3 R<sup>17</sup>, and an electron,  
provided that when one of R<sup>13</sup> or R<sup>14</sup> is an electron,  
then the other is also an electron;

15          alternatively, R<sup>13</sup> and R<sup>14</sup> combine to form =C(R<sup>20</sup>)(R<sup>21</sup>);

15          R<sup>15</sup> and R<sup>16</sup> are each independently selected from the  
group: a bond to L<sub>n</sub>, -OH, C<sub>1-C10</sub> alkyl substituted  
with 0-3 R<sup>17</sup>, C<sub>1-C10</sub> alkyl substituted with 0-3 R<sup>17</sup>,  
20          aryl substituted with 0-3 R<sup>17</sup>, C<sub>3-10</sub> cycloalkyl  
substituted with 0-3 R<sup>17</sup>, heterocyclo-C<sub>1-10</sub> alkyl  
substituted with 0-3 R<sup>17</sup>, wherein the heterocyclo  
group is a 5-10 membered heterocyclic ring system  
containing 1-4 heteroatoms independently selected  
from N, S, and O, C<sub>6-10</sub> aryl-C<sub>1-10</sub> alkyl substituted  
25          with 0-3 R<sup>17</sup>, C<sub>1-10</sub> alkyl-C<sub>6-10</sub> aryl- substituted with  
0-3 R<sup>17</sup>, and a 5-10 membered heterocyclic ring  
system containing 1-4 heteroatoms independently  
selected from N, S, and O and substituted with 0-3  
R<sup>17</sup>;

30          R<sup>17</sup> is independently selected at each occurrence from the

5 or a pharmaceutically acceptable salt form thereof.

7. A kit comprising a compound of Claim 2, or a pharmaceutically acceptable salt form thereof and a pharmaceutically acceptable carrier.

10

8. A kit according to Claim 7, wherein the kit further comprises one or more ancillary ligands and a reducing agent.

15

9. A kit according to Claim 8, wherein the ancillary ligands are tricine and TPPTS.

10. A kit according to Claim 8, wherein the reducing agent is tin(II).

20

11. A diagnostic or therapeutic metallopharmaceutical composition, comprising: a metal, a chelator capable of chelating the metal and a targeting moiety, wherein the targeting moiety is bound to the chelator, is a quinolone non-peptide and binds to a receptor that is upregulated

25

during angiogenesis and the compound has 0-1 linking groups between the targeting moiety and chelator.

12. A composition according to Claim 11, wherein the  
5 metallopharmaceutical is a diagnostic radiopharmaceutical, the metal is a radioisotope selected from the group:  $^{99m}\text{Tc}$ ,  $^{95}\text{Tc}$ ,  $^{111}\text{In}$ ,  $^{62}\text{Cu}$ ,  $^{64}\text{Cu}$ ,  $^{67}\text{Ga}$ , and  $^{68}\text{Ga}$ , and the linking group is present between the non-peptide targeting moiety and chelator.

10

13. A composition according to Claim 12, wherein the targeting moiety is a quinolone non-peptide and the receptor is  $\alpha_v\beta_3$  or  $\alpha_v\beta_5$ .

15 14. A composition according to Claim 13, wherein the radioisotope is  $^{99m}\text{Tc}$  or  $^{95}\text{Tc}$ , the radiopharmaceutical further comprises a first ancillary ligand and a second ancillary ligand capable of stabilizing the radiopharmaceutical.

20

15. A composition according to Claim 14, wherein the radioisotope is  $^{99m}\text{Tc}$ .

16. A composition according to Claim 15, wherein the

26. A composition according to Claim 11, wherein the  
 5 metallopharmaceutical is a MRI contrast agent, the metal  
 is a paramagnetic metal ion selected from the group:  
 Gd(III), Dy(III), Fe(III), and Mn(II), the targeting  
 moiety is a quinolone nonpeptide and the linking group is  
 present between the targeting moiety and chelator.
- 10 27. A composition according to Claim 26, wherein the targeting moiety is quinolone non-peptide and the receptor is  $\alpha_v\beta_3$  or  $\alpha_v\beta_5$ .
- 15 28. A composition according to Claim 27, wherein the metal ion is Gd(III).
29. A composition according to Claim 28, wherein the contrast agent is

20

30. A composition according to Claim 11, wherein the metallopharmaceutical is a X-ray contrast agent, the metal is selected from the group: Re, Sm, Ho, Lu, Pm, Y, Bi, Pd, Gd, La, Au, Au, Yb, Dy, Cu, Rh, Ag, and Ir, the targeting moiety is a quinolone non-peptide, the receptor is  $\alpha_v\beta_3$  or  $\alpha_v\beta_5$ , and the linking group is present between the targeting moiety and chelator.
- 10 31. A method of treating rheumatoid arthritis in a patient comprising: administering a therapeutic radiopharmaceutical of Claim 19 capable of localizing in new angiogenic vasculature to a patient by injection or infusion.
- 15 32. A method of treating cancer in a patient comprising: administering to a patient in need thereof a therapeutic radiopharmaceutical of Claim 19 by injection or infusion.
- 20 33. A method of imaging therapeutic angiogenesis in a patient comprising: (1) administering a diagnostic radiopharmaceutical, a MRI contrast agent, or a X-ray contrast agent of Claim 11 to a patient by injection or infusion; (2) imaging the area of the patient wherein the desired formation of new blood vessels is located.

34. A method of imaging cancer in a patient comprising:  
(1) administering a diagnostic radiopharmaceutical of  
Claim 12 to a patient by injection or infusion; (2)  
imaging the patient using planar or SPECT gamma  
5 scintigraphy, or positron emission tomography.
35. A method of imaging cancer in a patient comprising:  
(1) administering a MRI contrast agent of Claim 26; and  
(2) imaging the patient using magnetic resonance imaging.

36. A method of imaging cancer in a patient comprising:  
(1) administering a X-ray contrast agent of Claim 30; and  
(2) imaging the patient using X-ray computed tomography.
- 15 37. A compound, comprising: a targeting moiety and a  
surfactant, wherein the targeting moiety is bound to the  
surfactant, is a nonpeptide, and binds to a receptor that  
is upregulated during angiogenesis and the compound has  
0-1 linking groups between the targeting moiety and  
20 surfactant.
38. A compound according to Claim 37, wherein the  
targeting moiety comprises a quinolone non-peptide and  
the linking group is present between the targeting moiety  
25 and surfactant.
39. A compound according to Claim 38, wherein the  
receptor is the integrin  $\alpha_v\beta_3$  or  $\alpha_v\beta_5$  and the compound is  
of the formula:

25 41. An ultrasound contrast agent composition, comprising:

(a) a compound of Claim 39, comprising: an quinolone that binds to the integrin  $\alpha\beta_3$ , a surfactant and a linking group between the quinolone and the 30 surfactant;

(b) a parenterally acceptable carrier; and,  
(c) an echogenic gas.

35 42. An ultrasound contrast agent composition of Claim 41, further comprising: 1,2-dipalmitoyl-sn-glycero-3-phosphatidic acid, 1,2-dipalmitoyl-sn-glycero-3-phosphatidylcholine, and N-(methoxypolyethylene glycol

5000 carbamoyl)-1,2-dipalmitoyl-sn-glycero-3-phosphatidylethanolamine.

43. An ultrasound contrast agent composition of Claim  
5 42, wherein the echogenic gas is a C<sub>2-5</sub> perfluorocarbon.

44. A method of imaging cancer in a patient comprising:  
10 (1) administering, by injection or infusion, a ultrasound  
contrast agent composition of Claim 41 to a patient; and  
(2) imaging the patient using sonography.

45. A method of imaging formation of new blood vessels  
in a patient comprising: (1) administering, by injection  
or infusion, a ultrasound contrast agent composition of  
15 of Claim 41 to a patient; (2) imaging the area of the  
patient wherein the desired formation of new blood  
vessels is located.

46. A method of imaging therapeutic angiogenesis in a  
20 patient comprising: (1) administering, by injection or  
infusion, an ultrasound contrast agent composition of  
Claim 41 to a patient; (2) imaging the area of the  
patient wherein the desired formation of new blood  
vessels is located.

25 47. A method of imaging atherosclerosis in a patient  
comprising: (1) administering, by injection or infusion,  
an ultrasound contrast agent composition of Claim 41 to a  
30 patient; (2) imaging the area of the patient wherein the  
atherosclerosis is located.

48. A method of imaging restenosis in a patient  
comprising: (1) administering, by injection or infusion,  
an ultrasound contrast agent composition of Claim 41 to a  
35 patient; (2) imaging the area of the patient wherein the  
restenosis is located.

49. A method of imaging cardiac ischemia in a patient comprising: (1) administering, by injection or infusion, an ultrasound contrast agent composition of Claim 41 to a patient; (2) imaging the area of the myocardium wherein  
5 the ischemic region is located.

50. A method of imaging myocardial reperfusion injury in a patient comprising: (1) administering, by injection or infusion, an ultrasound contrast agent composition of  
10 Claim 41 to a patient; (2) imaging the area of myocardium wherein the reperfusion injury is located.

51. A therapeutic radiopharmaceutical composition, comprising:  
15 (a) a therapeutic radiopharmaceutical of Claim 19; and,  
(b) a parenterally acceptable carrier.

52. A diagnostic pharmaceutical composition, comprising:  
20 (a) a diagnostic radiopharmaceutical, a MRI contrast agent, or a X-ray contrast agent of Claim 11; and,  
(b) a parenterally acceptable carrier.

53. A method of treating restenosis in a patient comprising: administering to a patient, either  
25 systemically or locally, a therapeutic radiopharmaceutical of Claim 19 capable of localizing in the restenotic area and delivering an effective dose of radiation.

30  
54. A method of imaging atherosclerosis in a patient comprising: (1) administering a diagnostic radiopharmaceutical, a MRI contrast agent, or a X-ray contrast agent of Claim 11 to a patient by injection or  
35 infusion; (2) imaging the area of the patient wherein the atherosclerosis is located.

55. A method of imaging restenosis in a patient comprising: (1) administering a diagnostic radiopharmaceutical, a MRI contrast agent, or a X-ray contrast agent of Claim 11 to a patient by injection or  
5 infusion; (2) imaging the area of the patient wherein the restenosis is located.
56. A method of imaging cardiac ischemia in a patient comprising: (1) administering a diagnostic  
10 radiopharmaceutical, a MRI contrast agent, or a X-ray contrast agent of Claim 11 to a patient by injection or infusion; (2) imaging the area of the myocardium wherein the ischemic region is located.
- 15 57. A method of imaging myocardial reperfusion injury in a patient comprising: (1) administering a diagnostic radiopharmaceutical, a MRI contrast agent, or a X-ray contrast agent of Claim 11 to a patient by injection or  
20 infusion; (2) imaging the area of myocardium wherein the reperfusion injury is located.

(54) Title: VITRONECTIN RECEPTOR ANTAGONIST PHARMACEUTICALS

**WO 00/35492**

(57) Abstract: The present invention describes novel compounds of formula:  $(Q)_d-L_n-C_b$ , useful for the diagnosis and treatment of cancer, methods of imaging tumors in a patient, and methods of treating cancer in a patient. The present invention also provides novel compounds useful for monitoring therapeutic angiogenesis treatment and destruction of new angiogenic vasculature. The present invention further provides novel compounds useful for imaging atherosclerosis, restenosis, cardiac ischemia, and myocardial reperfusion injury. The present invention still further provides novel compounds useful for the treatment of rheumatoid arthritis. The pharmaceuticals are comprised of a targeting moiety that binds to a receptor that is upregulated during angiogenesis, and optional linking group, and a therapeutically effective radioisotope or diagnostically effective imageable moiety. The imageable moiety is a gamma ray or positron emitting radioisotope, a magnetic resonance imaging contrast agent, and X-ray contrast agent, or an ultrasound contrast agent.

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

Continuation of Box I.1

Although claims 31,32,53 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.

Although claims 33-36,44-50,54-57 are directed to a diagnostic method practised on the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.

Continuation of Box I.2

Claims Nos.: 1-4,7-15,17,19-22,24,26-28,30-57

Present claims 1-57 relate to compounds/kits defined by reference to desirable characteristics or properties, namely "receptor that is upregulated during angiogenesis", "targeting moiety", "chelator", "linking groups", "a surfactant", "quinolone nonpeptide".

The claims cover all compounds/kits having these characteristics or properties, whereas the application provides support within the meaning of Article 6 PCT and/or disclosure within the meaning of Article 5 PCT for only a very limited number of such compounds/kits. In the present case, the claims so lack support, and the application so lacks disclosure, that a meaningful search over the whole of the claimed scope is impossible. Independent of the above reasoning, the claims also lack clarity (Article 6 PCT). An attempt is made to define the compounds by reference to a result to be achieved. Again, this lack of clarity in the present case is such as to render a meaningful search over the whole of the claimed scope impossible.

Moreover claims 1-4,7-15,17,19-22,24,26-28,30-57 relate to an extremely large number of possible compounds/kits. Support within the meaning of Article 6 PCT and/or disclosure within the meaning of Article 5 PCT is to be found, however, for only a very small proportion of the compounds/kits claimed. In the present case, the claims so lack support, and the application so lacks disclosure, that a meaningful search over the whole of the claimed scope is impossible.

Consequently, the search has been carried out for those parts of the claims which appear to be clear, supported and disclosed, namely those parts relating to the compounds/kits prepared in the examples and specifically mentioned by name in the claims with due regard to the general idea underlying the present application.

The applicant's attention is drawn to the fact that claims, or parts of claims, relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure.
